

## Master Games

 for
## Master Players

The best games in the known Universe are available in your High Street and all good software stockists, NOW!
SOFTEK, Masters of The Game 12-13 Henrietta Street, London WC2

The Computer \& Video Games 1983 Arcade Championships were only decided during the last few seconds of the action in July's thrilling final day.
Bighteen finalists were invited to the plush Xenon nightclub to compete against one-another and Radio 1 DJ Dave Lee Travis.
Some of the finalists got up early that day to appear on the BBC's moming programme Breakfast Time for an unofficial championship warm-up.
Then the 18 split into six groups of three to tackle their favourite machines with the highest scorer moving onto the next stage of the competition.

to notch 73,110 points and take the title.
Julian took a cocktail table version of Galaga back back to his home in Llangeitho in Dyfed, Wales. He won his place in the final of the evergreen defender game which still attracted the most entries from arcade players across the country. The other games which made up the final were: Donkey Kong. Donkey Kong Junior, Mr Do, Robotron and Amidar.

Dave Lee Travis turned up at the end of the day to present the finclists with certificates, Donkey Kong Junior hand-held games-watches from CGL and Julian with his Galaga machine.

It's not often that the special delivery rocket arrives on this lonely outpost of the galaxy. But when it does there's always a rush to see the tatest issue of C\%VG. This photograph was captured by the lens of Mike Goss and the two aliens were put together by Dorian Cross. We hope you get as much out of the yearbook as Dorian put into this marvellous model.

## INTERSTELLAR INTRIGUE

Five hardened diplomats meet to share out the galaxy each hopes to wrest complete control for himself. Take the part of Grakta the Bloodline delegate or Maachen the lizard from the Water Empire (up to five can play) as the fate of suns planets and fleets rests on your negotiating. Mike Singleton wrote this novel and tactical game for the Spectrum. And there are versions for the Dragon, BBC and Atari too. Illustrated by Stephen Gulbis. Can you take control of the galaxy when the might of four other empires is ranged up against you?

## BEACON STAR WARS

 38Two alien tribes discover the secret of the beacon stars and realise that whoever controls this sector of space will have a say in the running of the galaxy. Their fleets of mining ships and gun ships help the race to produce stargates around the discovered stars. But what are the incredible space scavengers and how will they affect the outcome? Written for the Dragon by Ron Potkin, it's a well balanced and tactical strategy game for two players. Converted onto the Spectrum too. Illustrated by John Higgins. Can you out-think and outfight your opponent?

## PIRATES \& POLYPS

 52The polyps are a rare and precious space commodity which you hope to attract down to your planet with a deep space scanner. But the pirates are out to steal the polyps away and to wreck your scanner and ground lasers. It's a battle of wits as you try to draw a bead on the plrate ships in the atmosphere and blow them out of the skies before they make off with a polyp - or worse - dive bomb your defences. Written by Pat Norris for the Spectrum we also have conversions for the Atari. Vic-20 and Dragon. Illustrated by Peter Harris. Do you blow up a pirate or pull down a polyp? It calls for fast wits as well as quick reactions.

## Gavixs mpinyil:

YAHTZEE........... 92
Come on Bud, roll them dice! You know this game aint fixed. Join our disreptable team of dice-men.
3D MAZE 100
Get lost! And then find your way home again. That's the aim of this challenging maze escape game. Mind-boggling frustration for Sharp owners.

## METEOR ATTACK

$\qquad$
Your city is in danger. A heavy shower of meteors is heading straight for it from the depths of space. Your mission is to destroy them before they destroy youl Space action on the Atari.
TRACKER. 112
Androids are on the loose again and threatening the safety of everyone in Vic. ville.
PRC-MAN ........ 116
A heart-rending tale of a PacMan who thought he was going to be left out of this Yearbook. Fun on the Spectrum.

## $5=1$ :

## THE VESPOZIAN AFFAIR 68

DTaan knew that she was on the verge of a great discovery. all the information was at her fingertips she just had to put two and two together. But if she makes her discovery will she be able to persuade Captain Bezel to change course to the right planets in time? How far can she trust Grakta - will he turn her over to the Bloodline Empire and can Machen be persuaded onto her side? An adventure with a real difference by Keith Campbell, where the action moves through space, goes beyond the ship and where some of the characters move independently. It was written for the Dragon but we converted it to the Atari, Dragon and BBC. Illustrations by David Pugh.

## 

## MEET OUR ARCADE CHAMP

 3The page you've already passed. Read about the thrills and spills of our 1983 Video Games Championships and the skills of Julian Rignall, our worthy winner.

## EVOLUTION OF THE SPACE

 INVADERS .6We shed new light on the real strategies and motives behind the great invasion and find out that despite suffering enormous losses, the green meanies actually won.

## GAMES DESIGNER INTERVIEW. 10

Eugene Lacey talks to Dave Lawson, the programming brains behind Imagine Software.

## THE BIGGEST GAMES FACTORY 16

When it comes to games, more games come out of the Atari factory in Californic than anywhere else. But how many ideas finish up in the bin and how do they spot the winners.
SOFTWARE HOUSE .65
The processes which could put your game on the streets. How a software house deals with your tape and what you could earn. We talked to Visions about their games and programmers.

TIPS ON VIDEO GAMES
.96
How do you get to the final screens of Raiders of the Lost Ark? What's the best way to tackle Pitfall Harry. Eugene Lacey tells you how to tackle your favourite games.
LICENCING 104
It's big business and it's really taking off. Soon all your favourite book and film characters will be appearing on the small screen in computer or games centre form. Read about the million dollar deals which take them there.
THE FUTURE OF GAMING
107
In the future you will surrender all your senses to the game that comes into your home through a cable.
PINBALL CRAZY
109
Tim Metcalfe is pinball crazy, but he's not the only one. We sent him down to meet a family who think more about flippers and drop targets than even he does.
DARK CRYSTAL 129
We asked our magazine readers to draw a character or a scene from the fantasy Muppet movie, The Dark Crystal. Alan Outter was the winner and you can see just how he reproduced Jen the Gelfling on page 129. Then try it yourself on a BBC.

## TH1 R 135 s

PUZZLING 8
We asked Trevor Truran to set your Earthling brains enough puzzles to keep them busy until this time next year. Trevor starts Puzzling on page 8 and there are more on pages 12, 20, 106 and 128.

## THE BUGS

$\qquad$ .9
Every-so-often we have to kick ourselves to remember that the Bugs are the creations of cartoonist Elphin Lloyd-Jones They don't really exist in your computers. They go into action on pages 9, 14, 15 and 20. Ruining programmes, blowing up computers and planning chaos, just like they did in our computer room only last week. Maybe they are real after all!
EXPERTS............ 18
Would you like to add some professional gloss to your computer programs? We asked some software experts to tell us how on their computers. Malcolm Evans of New Generation Software gets to grips with the Spectrum on page 18. Simon Hunt of English Software explains how to get the best from the Atari on page 66. And Nat and Franklin of Salamander Software tame the Dragon on page 90.

## GLOSSARY...... 120

Puzzled by computer jargon? We'll put a stop to all that. Robert Schifreen has composed the definitive computer glossary to take the jargon out of computers.

[^0]
## EVOLUTION OF THE

Was there motive behind the madness of the great 70 s space invasion?

After some early success against the "untrained" defence forces, the later waves took an awesome hammering. Wave after wave was wiped out, sacrificed for the odd laser-base scalp - and still they kept coming.

For years the slaughter went on, some of the aliens began to look like the raw recruits they must have been, barely trained in the use of their lightning bolt missiles, before being rushed to the front line.

Reports of the carnage must have found their way back to the alien generals (or did too few scaucer messengers get through), news that Earth's unofficial defenders were getting their collective eye in. Could it be that these losses were acceptable?

The common or guardian invader (Invadus Nipponicus) was having a hard time of it and then a new breed emerged in the scene. The advent of wings made saucers unnecessary and this new species made use of the swarming principle to become Galaxians. No longer the steady trudge through the stratosphere accompanied by the inevitable grunts, these aliens wheeled down depositing a steady stream of bombs, trapping defenders in corners and diving kamikaze-like upon them.

A new mutation and the world fell victim to Defendus Åmericaans. The first game of a great series by Williams former designer Eugene Jarvis, he followed it with Stargate and finally Robotron, as the aliens switched their base from Japan to the U.S. for a short while.

But while the new aliens took over the space invaders' traditional territory in the crcades, the old enemy was planning a new campaign. It moved straight into the Earthly homes and setting up residence in the humans' previous major defence, the telly ... a master stroke.

No more escaping from the meanies by rushing home to watch Coronation Street, the little devils were their waiting for you, courtesy of the home TV games centres.

Atari VCS aliens were a different shape but undoubtedly the same

In 1977, when the first unidentified grunts were heard in your
local, the video games industry was born. If grew fat on the bach of the space invasion, arcades sprang up, new manufacturers began creating alternative invasions and it blossomed.
Then came the pruning years of 1981-82, when the nover wore off, leaving hardcore arcade go-ers who could spend hours on one 20 p and those who flirted with new video games a few 20ps a night in the pub.
Eye-catching graphics and sound effects which aftracted aftention, without driving everyone into the saloon bar, were
produced. produced.

With home TV games centres and personal computers forever narrowing the gap in time before they produce their own areade look-alikes, new thrills have to be constantly found and the arade videe games still lead TV games centres and home
computer games, in ind computer games, in innovation and standards of graphics and
sound.
breed: antennae wriggling, legs twitching and fighting in profile but invaders none-the-less.

And susceptible to earthly defenders, who cut them down in their droves. Could it be that the distant intelligence behind this concerted onslaught had made yet another error or tactical judgement - or was this manoeuvre more evidence of the subtle planning going on in some far comer of the cosmos?

Maybe so, because the next avenue of attack was a complete switch in tactics. No longer could mankind justify the slaughter of the galactic innocents by claiming that death was too good for the 'orrible little alien insects, who only had destruction in mind.

Pacman was different, all the characters were lovable. Here was a hero you could really relate to: a yellow featureless blob continually opening a black maw to sate his massive appetite.

Even the villains, the ghosts, were pretty cute: big doleful eyes and sweet names like "Blinky". Their mission might even have beon misinterpreted as reasonable - to prevent Pacman from eating their world
to destruction, Subtley mankind had been switched from the side of the good guy to become the destroyer of good guys.

We took this change in good stead and soon ghosts were disappearing almost as fast as invaders had once done. But in Pacman we had a game which could actually cause us physical injury. Games were interspersed by finger soothing sessions, when caloused and bruised joints were nurtured back into shape ready for the next bout.

While Pacman took over our hearts in the arcades, the space invaders had found a new realm to conquer as they blasted their way into the home computer circuits.

At first this latest manifestation of invader was barely recognisable as the real thing. Many of them were featureless, even more, suffered from a slowness and jerkiness of movement which made them easy and unsatisfying targets.

Worse still, many of the early versions, could not even fire back and merely relied on getting to the bottom of the screen.

But they were still thriving in this new medium, and people were crying for more and better versions pro - eventually these poor recruits were replaced by creatures that could pass for the real thing and the galactic invasion continued apace - although still more young invad. ers were destined never to see their mothers again.

## SPACE INVADERS

Pacman's insatiable appetite was also outgrowing the arcades as he munched and chewed his way onto the home screens. First he ignored the TV games centres by moving straight onto a variety of home computers. Then he backtracked to the Atari VCS system and arrived with a bang.
A whole new maze to wander and some flickering opponents to negotiate but Pacman was not a creature to let a change of environment ruin his appetite and the alien attack found itself with a new hero.
A heroine was not long in emerging as the attack was launched on the other half of humanity. Could women be tempted into the arcades by relating to Ms Pacman? Hardly a feminist heroine, despite insisting on the "Ms" part of her title. She had a bow in her "hair" and really just wanted to settle down and have baby Pacmen.
If women were the real target of Ms Pacman, then this was a setback to the cosmic intelligence's masterplan. Perhaps the real aim was to find a way of propagating Pacmen faster. Anyway, the male of the species took readily to Ms Pacman without worrying about role reversal, and turned it into a success.
Role reversal was fast approaching in another form. Donkey Kong pitted us against one of our tavourite horrors, a mighty gorilla capturing a starlet and escaping to the top of a tall - if unfinished building. We took the role of the poor carpenter Mario as he rushed to the starlet's rescue.
Then came Donkey Kong Junior and Mario was the enemy. A villain of the first degree, actually given the prefix wicked, who had locked up poor old Kong and was dealing out doom and destruction to the gorilla's heroic offspring as he tried desperately to rescue his Pa .
The Donkey Kong duo of games proved how fickle mankind's affections could be, we were putty in the hands of the great intergalactic game designer, if he told us black was white, we'd believe him.
It also reversed the trend of thousands of the enemy being wiped out for the odd one or two human
hero casualities. Now we were witness to the destruction of many Mario's without ever quite getting to grips with Kong.

And it also showed that the aliens producing these games had discovered our love of the cinema. They were giving us sequals like Space Invaders Part II and they were giving us heroes we already knew.
This trend continues to this day with Buck Rogers, Star Wars and Star Trek, being among the latest titles produced.
And the cinema played an even greater role in Tron, where the game was based on a film which was based on the game. And that fiction of film stars going inside the machine, is no being turned into fact by laser disc technology which uses
film clips to build up a game which switches the action to match the player's shooting and manoeuvring.

The alien intelligence has also moved back into its true colours, space creatures, as the new games prove: Xevious, Astron Belt, Mad Planets, Zaxxon, Gyruss...

The space invasion has been long, and it's been hard-fought and the casualties have been horrifying. But what have the invaders achieved at the end of it all?

Well, they succeeded where almost every film and fiction alien failed. They wormed their way into our culture, set up bases in our homes and in our social haunts and we've not only accepted their presence, we actually want to take the credit for it - in short, THEY WON!

## CRAZYKONG

Once again Dolores Devine has been foolish enough to join Crazy Kong on a sightseeing tour of the Empire State Building and is now standing somewhat reluctantly on the roof garden with her hairy host as he plays with a helicopter.

Only Lizardlegs can scale the building in time to save her and there just happens to be one safe way to the top.

Fortunately, by a coincidence a rare that you may be tempted not to believe it, the Christmas decorations in the office windows do mark out the route he must take.

Each symbol has a meaning. One represents UP, another DOWN, a third RIGHT and the fourth LEFT.

Just one snag - the symbols

change their meaning at each level and never have the same meaning again. So, whatever is, say UP on level one cannot be UP on levels two or three.

It may look an impossible task to find the only route and Lizardlegs, so adept at adhering to glass, is at a loss as to know how to begin his task. Can you help by marking out the one pathway?

It isn't as difficult a task as it looks

## BY TREVOR TRURAN

and the grid may help - enter a cross for an impossible meaning for a sign and a tick when you know it for sure.
A little thought and you can guide our window wiping friend to the root - but hurry, Dolores is screaming again and her voice has already put two TV stations off the air...।

|  | $\begin{aligned} & \mathrm{U} \\ & \mathrm{P} \end{aligned}$ | $\begin{aligned} & D \\ & 0 \\ & W \\ & \mathrm{~N} \end{aligned}$ | $\begin{aligned} & R \\ & I \\ & G \\ & H \\ & \text { H } \end{aligned}$ | $\begin{aligned} & \mathbf{L} \\ & \mathbf{E} \\ & \mathbf{F} \\ & \mathbf{T} \end{aligned}$ | $\begin{aligned} & \mathbf{U} \\ & \mathbf{P} \end{aligned}$ | $\begin{aligned} & \mathrm{D} \\ & \mathrm{O} \\ & \mathrm{~W} \\ & \mathrm{~N} \end{aligned}$ | $\begin{aligned} & \text { R } \\ & \text { I } \\ & \text { G } \\ & H \\ & T \end{aligned}$ | $\begin{aligned} & \mathbf{L} \\ & \mathbf{E} \\ & \mathbf{F} \\ & \mathbf{T} \end{aligned}$ | $\begin{aligned} & \mathbf{U} \\ & \mathbf{P} \end{aligned}$ | D <br> 0 <br> W <br> N | $\begin{aligned} & \text { R } \\ & \text { I } \\ & \text { G } \\ & \mathrm{H} \\ & \mathrm{~T} \end{aligned}$ | $\begin{aligned} & \mathbf{L} \\ & \mathbf{E} \\ & \mathbf{F} \\ & \mathbf{T} \end{aligned}$ |

DAMAGED GOODS
Another failing of the McCoy Co is their employment of drivers who believe that corners are optional. As you can see, the latest consignment of video favourites has arrived at the rear of the premises in something of $\alpha$ mess.
When the lorry set out each layer contained three types of cartridge but the collision with the wall has concertina-ed the contents.
The only good thing is that the letters of each game are still in their correct order, so, if you don't mind
lending a hand, you can name al twelve games and restore order from chaos.
Otherwise the world will have to get used to KOGRZERSH in the Top Ten and no one will play a game with that name, will they? Top Layer: BERZERK TRICKSHOI FROGGER
2nd Layer: GALAXIANS PACMAA UTOPIA
3rd Layer: PHOENIX DRACULA PIT. FALL
4th Layer: MEGAMANIA STARMAS TER DEFENDER

# The New 

 Heroes> We take you to Liverpool to meet Dave Lawson the designer/ programmer of Arcadia, Spectral Invaders, Spectral Spectres, Ah Diddums, and Schizoids.

IF there is one person in England who you could describe as the country's top games programmer it must surely be Dave Lawson.

Like a top pop star Dave, cofounder of Imagine, the Liverpool software house, can look back on a string of number one hit games.

But Dave's successes have not just been top selling games they have also been first in other respects.

Spectral Invaders was the first commercially produced game for the Sinclair Spectrum, Space Warp the first commercially produced game for the BBC, and Dave was also heavily involved in the controversial Vic Men, the first game for the Vic20.

Soon after these games were produced Dave wrote one of Bug Bytes' all time greats - Spectrum Spectres. The money earned on Spectres enabled him to go into business for

Lawson: "I knew my work would be valuable one day"
himself with another ex-Bug Byte employee - Mark Butler - and so Imagine was born.

Shortly after the split with Bug Byte Dave was back at the keyboard but this time writing games for his own company. By last Christmas Imagine were able to launch their first game - Aracdia. The game was an instant hit on the Spectrum and has since been converted for the Vic-20 and the Commodore 64.

Pressure of running an expanding company has forced Dave away from the computer though he still found time to write Ah Diddums, released in January.

I managed to steal an hour out of his hectic schedule to find out a little about the man behind the games.

Born twenty-three years ago in Liverpool and educated at Quarrymount Secondary Modern, Dave left school and home at 15. "I lived with
friends and did odd jobs - anything really. It's easy to get jobs if you get the technique right. I spent the next two years hitch-hiking, sometimes by myself and sometimes with othe: people.
"When I was seventeen I joined the merchant navy as a trainee engineer. The next year and a half were spent at various colleges. It was boring. They make you spend about four years at college before you get anywhere near a ship."
The navy and Dave parted company in the summer of 1979 and he was back in Liverpool, back to the odd jobs and the hitch-hiking but this time much further afield Spain, Italy, France and Germany.
He shrugs at the suggestion that hitch-hiking can be a lonely way of travelling: "It teaches you to be independent."
It was at this time that Dave's
interest in computers began. "I'm a compulsive reader. I read anything. I started reading electronics magazines especially Electronics Today International. I got interested in it because it seemed difficult. Eventually I saw an advert for a kit computer - a Nascom. I went straight out and bought one from Microdigital in Liverpool."
"It took me about a week to learn machine code. I didn't bother with basic. I couldn't see the point."
Dave was soon writing his own programmes and developed a sharp disapproval for the professional software currently available in the entertainment field. Of his own work at this time he was more confident. "I knew it would be valuable one day".
Valuable could be taken as something of an understatement from a man who has just taken delivery of a brand new Ferrari Mondiall.
A Ferrari is hardly the choice of a modest man, although Lawson insists that the money is not his main motivation. "The money means nothing to me. It's the satisfaction of being the best. I feel proud of our games and proud of Imagine. We are also providing people with good quality products, which also gives me pleasure".

His current project is the setting up of what Dave calls $\alpha$ "software development environment". This is an ideal set of circumstances, tools, working conditions, programmers, and artists which collectively produce a good computer games production line.
"There is no quick way of writing a good game. We brain storm our programmers all day. Fire ideas at them. We now have two artists working on graphics for the games. In the ideal programming environment the artists and programmers would work together throughout the course of the project."

Since Imagine's launch less then twelve-months ago the company has spawned an advertising agency and there are half a dozen other companies in the pipeline.

Lawson believes in himself and partner Mark Butler. "I think we make a great team. I met him in Laskys. I was playing Star Raiders at the time and he came up to me as a salesman. Good game, he said. I'm going to write one much better I

Arcadia, Spectres, and Spectral Invaders, "classics" that every Spectrum owner would want in his collection.

Ah Diddums

Spectral Invaders

Spectres
scid."
In the short term Imagine will be continuing to produce games for the Spectrum and also for the Commodore 64 before the end of the year.

Lawson says his long term plans are: "To become the biggest software company in the world and to become a public company by 1985."

And with what he has achieved so far we're convinced that this software supremo will do just that.

Lawson's first job in the computer games came as a result of seeing an article about a comparatively unknown firm that had just moved to Liverpool.

The firm was called Bug Byte and Dave was invited to join the team after showing the firm's bosses how to use one of their new computers.

When the Spectrum first appeared all the software houses were racing to get the first game on sale.

Dave was Bug Byte's main hope in this race and after thirteen failed production models managed to write the game from a pre-printers copy of the Spectrum Users Manual. Bug Byte were gambling that the manual and Lawson's interpretation of it were one hundred per cent accurate. The gamble paid off and Spectral Invaders is to this day the most accurate copy of arcade Space Invaders available for the Spectrum.

Dave's talent for arcade cloning was to pay off again for Bug Byte when Dave wrote Vic Men, a straight take-off of Pac Man, for the then new Commodore machine. Unfortunately for Bug Byte the game had to be withdrawn in the face of a threat of legal action by Atari - the holders of the Pac Man copyright.

For Imagine the past nine months has been a period of unprecedented growth.

They have gone from a small office with three employees to a large office block in the centre of Liverpool with twelve employees.

Imagine's General Manager Bruce Everiss boasts proudly of "taking scousers off the dole". When we set up our own production and packaging facility we will take "first seven and then forty scousers off the dole".

Here at Computer and Video Games we reckon that Lawson and Imagine will be creating games that will keep them in the limelight for years to come.

## THESPLURGS OF MOG

 GOT TO SEEBaOTO SEE

# The Biggest Games Factory in the World <br> More games ideas are suggested, investigated and discarded at the Atari research and development complex at Sunnyvale in California than anywhere else on this planet. Eugene Lacey looks at the way the games are thought up, the processes they go through and why the ideas that survive have to be among <br> designer and programmer interchangeably . . . we try to set a theme 

## the best around

The biggest games factory in the world is to be found at Sunnyvale, California, on the west coast of America.
That's the home of Atari's video games design plant where a team of over one hundred programmers, designers, and artists work unceasingly thinking up new ideas for/and developing video games.

The man responsible for running the whole operation is 37 -year-old Condon Brown.

While many of you were asleep in your beds Computer and Video Games spoke by telephone to the man behind the games.

Fifteen years of experience in the computer business, that involved working as a programmer and eventually running his own consultancy, led Condon to be offered what many people consider as the top job at Atari one-and-a-half years ago.
"We eat, sleep, and breathe games at Sunnyvale . . . and it's not just at work. . . I seem to spend a lot of time at the breakfast table discussing a game . . . or some part of a game with my wife.

Does she ever get sick of it? Loud laughter. "Just occasionally."

The game design process is a mixture of formal, and informal discussion, involving a set team of people and a floating pool of specialists.
Brown sees three main categories of game: The coin operated arcade game conversions, such as Pac Man and Space Invaders, licensed games where the company buys the rights to use a well known character or story line, and totally original games thought up by Atari's designers.

Atari keep the numbers of games they have sold a very closely guarded secret though it is known that the arcade conversions are the best sellers. Pac Man is the most successful to date and is thought to have sold more than 10 million copies world wide.
Brown believes that the penchant for arcade conversions will not always be what the public wants and that the original games will become more popular.
To find good original ideas he arranges "brainstorming sessions" to attempt to tease out an idea from a group discussion. Between eight and 10 designers and programmers attend the meetings. "I use the terms
for the meetings. It might be space adventure, maze, children's, or action games. These session can last anything from $11 / 2$ hour to all afternoon. Apart from time, place and theme we try to keep it informal."

Brainstorming sessions are an important part of the games factory output though Brown also stresses the importance of the individual flash of inspiration, "as many ideas come purely from one person as do from the brainstorming sessions".

Brown would like to see the whole company involved in the origination of new games process: "I regard the wider company as a potentially untapped resource."

Although the original games are often the most time consuming licensed titles and arcade conversions also present difficulties.
"We have to work within the limitations of the hardware - which usually means within the confines of the Atari VCS. Unlike the arcade machines which can constantly be improved in terms of their capabilities the VCS always remains the same.
"There is also the problem of trying to decide how licensed titles like ET \& Raiders of the Lost Ark for example can best be used."

When Atari are convinced that an idea for a game is a good one the project is then handed down to $a$ Cluster Group.
Each cluster group is made up of between five to eight people under the control of the cluster leader who in turn is responsible to Condon Brown.
Before an idea is assigned to a certain Cluster Group to turn it into a game a detailed Story Line and description of the game has to be produced for management approval.
This will contain detailed description of the gameplay, difficulty levels, and graphics together with precise market research to describe exactly whom the company believes will buy the game and why.
The next stage is to decide on a time scale for the completion of the project. This has to be flexible and games have taken from as little as five weeks to $a$ year and a half to get into the shops. It is not only unforeseen technical difficulties that can put a project back - Atari also give careful thought to when is the right moment to put any given game on scle.
"We have to ensure that there is not a glut of games at one point in the year and a shortage at another."
There are usually as many as 10 games being developed at the same
time though not all of these are destined to go into full scale production.
The cluster groups are teams made up of various specialists: a sound engineer who works on sound effects, a graphic artist who works with the programmers, and a composer to make up musical jingles, theme pieces for the games. There are also individual specialists whom the cluster can seek advice from on any point.

These specialists often have long term projects of their own but are regarded as a shared resource by the cluster groups.
When a project is underway its progress is constantly monitored by the cluster leader. "There is lot of input into the group . . . particularly from software marketing . . . but the final responsibility for what the game will be like rests with the designers."
Condon Brown stresses the team approach to design but also believes that there is room within the structure for designers who prefer to work by themselves. He cites the case of Howard Warsaw who developed the Raiders of the Lost Ark game by himself. In an earlier interview Warsaw told $C \& V G$ how he worked out the conversion of the film into $\alpha$ video game after sitting through four screenings of the film.

The quality of Atari's games, like that of any other video game manufacturer, depends on the strengths of the design team. One thing. Brown has to come to terms with, is the tremendous amount of poaching that goes on in the industry.
"We pay very well and generally have the pick of the industry."
He does not believe there is any set type of designer that fits into the Atari mould. "They come from many different walks of life . . . and range from 17-year-olds to PHD's . . . the one thing they all have in common is an abiding fascinating and love for computers.
"We try to select people with a proven track record and would normally expect some knowledge of advanced languages such as assembler language, and sequential processes . . . it is not important for a good designer to have a strong mathematics background.'
The advanced knowledge the designers attain in the existing range of Atari computers means that their opinions are highly valued by the hardware researchers. "Because they have to work within the confines of set system they quickly start to think how much more they could put into a game if the computer had extra capacity in certain areas.

The conversion of games is a recent problem for the designers and a feasibility study has to be produced as early as possible in the development of the game if it is likely that Atari would want to market the game for other computer systems.

Not only games for specific systems but games for specific parts of the world designed to cater for the different culture and tastes.
The first of these games Astrisk and Obelisk was currently being under development when we spoke to Condon Brown. "It's based on the cartoon characters and is designed with the European market where they are particularly popular. It will be test launched in France later this year."

With several million Pac Man, Space Invaders, Galaxians and others too numerous to mention now in millions of homes there can be little doubt that the Sunnyvale plant is quite definitely the biggestgames factory in the world.
And what does the man in charge of it all like to do to relax? "I enjoy a game of Defender". Careful with those smart bombs Condon.

#### Abstract

Malcolm Evans of New Generation Software probably knows the Spectrum as well as anyone.

Here, Malcolm gives you the benefit of all that experience as he undertakes to get a little animation going on the Spectrum.

Although the Spectrum has a character set fixed in its ROM, certain ASCII codes are not assigned to a particular character.
These can be defined by the user to be any chosen character and can then be printed either by entering graphics mode and using one of the letters from $A$ to $U$, or by printing the character using CHRS which will output the specific ASCII code.
There are 20 user definable characters on a Spectrum and they occupy ASCII codes 144 to 164.
If you type PRINT USR("A") the machine will give the location of the first byte of graphics data. The first 8 bytes including that one will hold the data for the first character and so on. There are 20 characters which is 160 memory locations.
To calculate the actual data for the characters, you first need to design it on a piece of $8 \times 8$ squared paper. Each of the 64 squares can either be coloured in or left unshaded.

When you have finished designing your character you need to convert each horizontal row of coloured and empty squares into a binary number. To do this use the BIN function. Use a 1 for each coloured square and a 0 for each unshaded square. When you have your eight binary numbers then you simply poke the data into the memory like this ...
POKE USR ("A"), BIN 10100010
POKE USR("A") +1 ,BIN 10001100
POKE USR("A") +2 ,BIN 01101100
And so on until you have poked in all 8 rows. This will continue until you reach USR("A") +7 .

This defines user defined graphic character A. To define any others simply use USR(" B "), then USR("C"' and so on:
This article outlines the use of user defined graphics, to achieve smooth

ILLUSTRATION 1
Illustration one shows two characters which form a larger figure.
Illustration two then gets him moving through four walking positions.

Position 2

Position 4
animation to enhance the graphics in your own programs, and continues to show how to extend the user defined graphic symbols far beyond the 21 characters in the Spectrum specification.
Pages 92-93 of the Spectrum manual outline the use of user defined graphics characters.
It is simple to combine such defined characters to form a larger figure. Figure 1 shows two such characters arranged to produce the figure of a walking man. If we were to draw such a figure on the screen and attempt to move it to the right it would appear to hop. Listing 1 shows a program to do just this.

Ideally we need to draw the figure moving smoothly across the character boundaries. This we can do by adding intermediate figure positions using four characters (2 wide by 2 high). Even when the figure is within the pair of characters, 4 are still necessary since a trailing pair of characters is required to blank out the remains of the figure as it is moved forward to the next character position on the screen.

Listing 2 shows one way of achieving the required animation. Lines 10-70 convert the picture data into
the user defined graphics $\AA$-P.
Another graphics character has been introduced to provide a ground plane. They have been entered in this manner so that it is easy to modify the pictures at any time. Line 1030 draws the four characters that make up the man quickly. There are two FOR-NEXT loops. $N$ determines which of the four intermediate pictures is to be drawn, and M the position across the screen.

Using a similar method, it is possible to animate the figure to move in any direction. Each direction requires further User defined graphics characters. Since we have already taken up 17 of the 21 available, we must find some way of extending the capabilities of the Spectrum.

The beginning of the character set used by the Spectrum system is pointed to by a system parameter called CHARS at location 23606 and 23607.

This good piece of foresight of the Spectrum programmers allows the user to POKE into these locations to produce new character sets.

Listing 3 introduces another six characters to provide the pictures of the man falling. Since the size of the figure is one character wide and two high, by previous arguments it is necessary to use a set of characters three high to move the figure up or down. These additional characters are available since CHARS has been POKED to 30208 (location 23607 having been POKED to 118). The first usable character ( CHrS 32 ) is at 30464. Only two intermediate positions are provided this time to speed up the fall rate.
To add some humour (even if it is sick) lines $1100-1240$ have been introduced to complete the demonstration loop. The POKE at line 1200 is to amend the scroll count SCR CT to ensure that the subsequent prints of char\$ 36 (a blank) result in the screen being scrolled.

When you press BREAK to leave the loop you will still be in the alternative character set. Don't panic. Simply poke 23607,60 , trying to ignore the gibberish that the basic system puts onto the screen, and the system will regain some form of intelligence.

## PU LING

## PUZZLEPROG

This very basic computer program which, with very little adaptation, should run on most machines, asks you to sort out a tangled mess into four eight-lettered words.

At present the letters are stored in pairs in an array and you could, of course, produce the words:
COLOSSAL
CRIMINAL
COMPUTER
CALAMITY
on your screen just by changing the order of the pairs in the DATA statement.

This is definitely NON-U and is frowned upon. Anybody who would sink that low would never reach their keyboard again!

You are invited having typed in the program, to RUN it; your screen should produce the array:

| $S S$ | $M I$ | $A L$ | $I N$ |
| :--- | :--- | :--- | :--- |
| $L O$ | $C O$ | $C A$ | $I M$ |
| $U T$ | $A L$ | $T Y$ | $E R$ |
| $M P$ | $C O$ | $C R$ | $L A$ |

At each turn enter three INPUTS; A and $B$ give the column and row of the array pair to be moved and $C$ the

## DUCKSHOOT

McCoy's, despite the name, is probably the cheapest software house ever to rent an accommodation address in downton Dorking.

Indeed, the most expensive part of all their products is the cassette holder.
Still, their fairground replica does actually run although the ducks don't even waddle and only three players can fire their six shots before the inevitable program crash.

It so happened that Nigel, Jane and Tracey in their first attempt managed to hit one duck with each shot; the bird, quite properly, disappearing from the screen. After the final shot had demolished the eighteenth duck the display briefly showed that they had each scored the same total before all went blank.
If Tracey hit more 20 's than Nigel who hit more 10's than Jane you can work out which six ducks each shot, can't you?

Five of the most powerful and influential beings in the galaxy meet on board the orbiting space station of Far Funus.
Their declared intention is to bring peace to the galaxy by settling their differences, over the negotiating table, diplomatically. Secretly, each of these warlike beings hopes to outwit the other four and seize control of the galaxy for his empire once and for all.
There's Bezel from the Pirate Empire resplendent in his burgundy and magenta robes but a creature none of the others would trust as far as they could have thrown his feared and awesome ship, the good vessel Vesporion.

All of the others are at a disadvantage when haughty Shazaz-Ka looks them in the eye. They dare not return the stare of this subtle diplomat from the powerful Sun Empire, for fear of being permanently blinded. He uses this advantage sparingly but his terrible frown falls most regularly on the illmannered Bezel.

In contrast, the brutish gesturing and roaring from infamously ill. tempered Tiaithan Lizard delegate Machen, threatens to disrupt the proceedings at every turn. The others excuse his behaviour by making allowonces for his being out of his natural amphibious
environment but they are not so quick to dismiss the threat his numerous blueemblemed Water Empire forces pose.

No-one has ever discovered the name of the anonymous Ice Warrior, whose features remain hidden behind a glacier mask and whose grating voice is disguised by the crackling breathing apparatus that serves him on this mission. He represents the weak and muchscattered Dead Empire, whose voice at these proceedings is only heard because no other empire can take control of the inhospitable planets and dying stars where they live.
But while they look
down on the primitive resources of the Dead Empire and the irony that these most lifeless of beings have chosen vibrant green as the distinguishing colour of their poorly-equipped fleets, the others keep one wary eye on his ice-axe. And all know the value of an ally capable of inhabiting planets where no-one else can visit - let alone live.

Lastly comes Grakta of the Bloodline Empire. Traditionally the rulers of this galaxy and let none estimate his cunning which is the result of 27 generations of careful cloning.

His power relies on the Bloodline's long control of the stellar energy, but
now it is under fierce attack from all sides - yet knowing Grakta he may still win the day.
The five are sat around a board, with their base stars, outlying stars and fleets on it . As the fortunes of galactic war ebb and flow before them they argue, connive, ally and betray to gain the upper hand for their respective empires.
Any is capable of wresting complete control, but each must use the others in brief alliances, all will try to prevent any other from becoming too powerful. It's diplomacy on a cosmic scale for two-five players and no holds are barred.

## THE RULES

## FURNS

Players take it in turn to make their moves. The order of play is decided randomly by the computer at the beginning of the game. For each star a player owns at the beginning of his turn, he gets one movement point.
During his turn he uses these movement points in moving fleets, rotating fleets and firing at other fleets.
The player does not have to use all his movement points and in fact can use none if he so wishes. Movement points, however, cannot be "saved up" for the next turn. If they are not used, they are lost.
A player with no movement points misses his turn. This does not necessarily mean he is out of the game. If he still has some fleets left, the actions of another player may still enable him to capture a star without even moving and then he will find himself back in the game!

## MOVING A FLEET

Moving a fleet one space costs one movement point. A fleet can only move into an adjacent empty space. A fleet must move forward, left or right.
It cannot move backwards. Once it has moved, it will be pointing in the direction it travelled. A player, of course, can only move his own fleets.

New fleets can be created at stars a player owns. To bring a new fleet into existence, the player simply makes a move from the star into an adjacent empty space. This move can be in any of four directions, north, east, south or west.

## ROTATING A FLEET

Rotating a fleet costs one movement point. The fleet can rotate through 90 or 180 degrees. When rotating, the fleet remains in the same space and simply changes direction. To rotate a fleet, the player must own it.

## FIRING AT A FLEET

Firing at a fleet costs one movement point. A player can fire from any star or fleet he owns at a fleet in an adjacent space. If he fires from a star, he can fire north, south, east or west. It he fires from $\alpha$ fleet, he must fire in the direction the fleet is pointing. The target fleet is always destroyed, even if it belongs to the player himself! Stars cannot be fired at or destroyed.

## CHANGE OF OWNERSHIP

Ownership of a fleet or star can change as a result of movement, rotation or firing. It always depends on the new situation created by. a player's action and any changes of ownership take effect immediately.

Ownership is determined by the fleets "attacking" that star or fleet. A fleet is said to be attacking another fleet or star when:

1) It is adjacent to that fleet or star.
2) It is pointing directly at that fleet or star.
3) If it is attacking a fleet, the two fleets are not pointing towards each other. A fleet cannot attack a fleet that is pointing towards it. Therefore, fleets pointing towards each other do not affect each other.
The following rules govern the ownership of stars and fleets:
4) If no fleets are attacking, ownership of a fleet or star does not change.
5) If there are ONLY neutral fleets attacking it, the fleet or star becomes neutral itself.
6) If each of the attacking players has an equal number of fleets attacking it, the fleet or star becomes neutral.
7) If any player has more fleets attacking it than any other player, then the star or fleet is captured by that player and becomes his star or fleet.
8) Neutral fleets are only counted as attacking fleets if no other players' fleets are involved.
Each move a player makes involves a potential change in ownership of surrounding fleets and stars. In certain situations, chain reactions can occur. Imagine, for example, a line of fleets pointing towards each other. If ownership of the first fleet in the line changes, this will cause ownership of the next to change and then the next again. Such changes take effect immediately, not just at the end of a player's turn.

## DURING MOVEMENT OF A FLEET

1) Removes fleet from map. Checks for changes.
2) Puts fleet in new position. Checks for change in ownership of that fleet.
3) Checks for changes in ownership of newly attacked fleet or star and any connected fleets.

## DURING ROTATION OF A FLEET

1) Rotates fleet. Checks for change in ownership of the star or fleet that was under attack.
2) Checks for change in ownership of rotated fleet.
3) Checks for change in ownership of newly attacked fleet or star.

## AFTER FIRING

1) Check for change in ownership of fleet or star that the destroyed fleet was attacking.
All checks for chamges in ownership always involve a check on any connected fleets or stars, so chain reactions may occur in any stage of the checking.

## WINNING

The object of the game is to bring peace to the galaxy. The winner, therefore is the only player left who can make a move. To win, you must leave the other players with no stars and thus no movement points.

## THE CONTROLS

$\mathbf{C}=$ CHOOSING
M = MOVING
R = ROTATING
$\mathbf{F}=$ FIRING
$\mathrm{E}=$ END YOUR TURN $\mathbf{S}=$ SAVE THE GAME ON TAPE
CURSOR KEYS are used for direction of movement, rotation or firing. They are also used to control the movement of the square cursor during the CHOOSING option.

In the CHOOSING option you can move the square cursor to any fleet or star you own. You can also choose any of the other options. When you choose to move, rotate or
fire, the fleet or star will begin to flash. Then you press a direction key and the action will occur. You return to CHOOSING automatically after rotation or firing but during MOVING you must return by pressing $C$.

E enables you to end your turn at any stage. Butonly when CHOOSING.
$S$ enables you to save the game on tape at any stage. When loaded back in, the program will recreate the exact conditions that held when you pressed S. All you need to do cfter pressing $S$ is give the saved game a filename.

## RUNS ON A BBC MODEL B．CONVERTED BY STEVE WILLIS

Loaded in two parts 1．＂INTRIGE＂2．（loaded automatically by 1．） ＂INT \＃2＂

The major problem with this conversion was the need to use the BBC MODE2 to gain the required colours for more than two players．Again this led to the further problem of needing 32 character width on a 20 character display．

The games uses all 32 characters，by displaying pair together，to give 16 large characters．Rearranging the charac－ ters to only use 16 meant a rather sick display．In the end I redesigned the Spectrum characters so that they can be over－ lapped．
This overlap is achieved by printing the left－hand character， then back spacing（using the VDU5 graphics motion of the cursor）by a character width．Finally the right－hand half of the character is printed．Thus 2 characters which would take 128
pixels（ $2 \times 64$ ）now take 96 pixels（ $64-32+64$ ）．With 1280 pixels across this still isn＇t enough．

By then reducing the＇used＇amount of each character in the 1 direction to $5 / 8$ ths we further reduce the character to 80 pixels wide．This gives us 32 across！In the Y direction we have 3 available lines so there is no problem except to match the find shapes．This all sounds complicated but is achieved in the end by rewriting the character definitions in＂INTRIGE＂and ther line 120 in＂INT \＃2＂does everything！
Now the second effect of using MODE2，is the lack of spact available for variables；or to be more precise for string vari－ ables．This game in its original form used two large string arrays and this proved impossible on the BBC．This has bees overcome by storing the display information，previously held in $\mathbf{S}(\mathrm{X}, \mathrm{Y})$ \＆ $\mathrm{Cs}(\mathrm{X}, \mathrm{Y})$ ，by POKEing in the spare areas of the

computer where no Basic may venture．
For this I have used $\& A O O$ to $\& B F F$ and the program now PFEKs and POKEs these areas．The relationship is as follows：－ $\mathrm{SS}(\mathrm{X}, \mathrm{Y})$ becomes ？$\left(2816+10^{\circ} \mathrm{X} \%+\mathrm{Y} \%\right)$ $\mathrm{C} \$(\mathrm{X}, \mathrm{Y})$ becomes ？$\left(2560+10^{\circ} \mathrm{X} \%+\mathrm{Y} \%\right)$
$A_{s} X=168 Y=10$ dre the maxlma，one can calculate that there is an unused gap from 2731 to 2826 ．In fact these locations are used when saving a game（we will discuss this in a minute）．
Thus the $\mathrm{SS}(\mathrm{X}, \mathrm{Y})$ \＆ $\mathrm{CS}(\mathrm{X}, \mathrm{Y})$ strings have been replaced throughout and，as in all the games，$X \%$ \＆$Y \%$ etc．（integer variables）have been used．In fact as the data storage is numeric in the game this is more efficient than evaluating VAL （string）all the time as in the SPECTRUM version．

Now to SAVEing and LOADing games．SAVEing a game is achieved by storing a machine code dump of locations \＆AOO to \＆BAA in the file named＂INTINT＂on tape or disc．At the time a

SAVE is requested，the player＇s names，number of moves allowed，and player colours are loaded as an ASCII dump into the spare area from 2731 to 2816 （lines 31 to 38 ）．The whole data stream is then SAVEd．
The option of LOADing a saved game is selected at the start of the first program．If an ＂ S ＂is entered instead of the number of players，then when the main program has loaded the player puts a previously saved game tape in the recorder and it will be loaded．The game is then running．

With tape storage several saved games can be stored on one tape or several tapes．However they are all called＂INTINT＂ this could be modifiod if you wish quite simply．Both SAVE \＆ LOAD work correctly to a disc system．

Finally PAGE has again been set to $\$ 1200$ if a disc system interface is in use，or \＆EOO if not．This allows the use of MODE2 with disc vorsions of the game．

## 

All over the galaxy con－ tests like this are being fought，each unique in its own way and yet each similar in so many aspects．
Who was to guess that the emnity between the forces of Bluuton and the crimson ships of Redare would last thus long and be so intense？But greed is a strange thing and both of these ambitious space tribes knows the full worth of the riches which are being uncovered before their very eyes．
Both know that they must keep the secret from the mighty empires，which would rush in and swal－ low the prize and wipe out the squabbling tribes like so much space dust．

And both tribes know that if they can harness this wealth of energy for themselves then their tribe might one day rank as high as those great empires and control just as large a slice of the galaxy ．．．but first ．．． they just have to defeat their rivals．
The Beacon Stars，rich in stellar energy，had lain there for eons but their light had been stifled by the darkness and their power remained undisco－ vered in the blackness of the＂Dead Areas＂into which no spacecraft dared travel．
Then came the Scaven－ gers，$\alpha$ strange space phe－ nomend，no－one ever saw them none knew where they would strike next and few could but wonder at the results they produced．

The first sign was a strange green glow in the night sky where $\alpha$＂Dead Area＂had been before and then the blackness was gone forever and sometimes a bright Beacon Star shone out from where the darkness had been．

The Beacon Star Wars are fought out between the fleets of Redare and Bluuton as they rush to capture the stars and use them to produce the stel－ lar－energy creating Star－ gates．

Their fleets are made up of Miner ships fast and useful for exploration and Gun ships，slow but mighty in battle．

And each has a base stargate，immovable but strong in defence and able to produce new ships to add to the fleets．

Other stargates can be built on the sites of cap－ tured Beacon Stars by hav－ ing a Miner ship and $\alpha$ Gun ship adjacent to the Beacon Star and canniba－ lising these to create $a$ star gate．

Every star gate pro－ duces three E．R．Us every turn and these are the mark of who is winning the game．These are also the basis of new ships， from the cheap to produce Miners，to the expensive Gun Ships．

## OPERATING INSTRUCTIONS

1．Rewind the tape fully and press the PLAY button on the recorder．Type CLOAD and press ENTER．
2．Once the program has been loaded－it takes about 60 seconds－type RUN and press ENTER．
3．There will be a slight pause．The logo and title will then appear on the screen．This indicates that the board is being prepared．
4．The board appears with the Bluutons on the left side of the screen and the Redarians on the right．The Dead Areas appear in the central part of the screen．
5．The bottom part of the screen is devoted to messages and information．Currently，this will be flashing the mes sage：

> BLUUTON
> PRESS ENTER

The Bluutons always move first．

## THE RULES OF PLAY

## 1．Objective．

To earn the most number of energy resource unt （ERU＇s）before the last Dead Area is cleared．

## 2．Sequence of play．

a）The Blue player moves his pieces．The commar 6 available are：
Move－use the numbers 1 to 6
Jump－press＂J＂
Capture－occupy a Beacon Star
Produce－press＂$P$＂
Complete－press＂C＂．Checks for remaining attackexp Finish－press＂F＂．Does not check for attacks．
b）Combat takes place．The computer will determine 7 ． result of all attacks．
c）One Dead area is removed from the board．The At t area to be cleared is determined and painted blue brot d）Scavenger explosions are determined and pait： green．
e）The Red player now plays and steps（a）to repeated．
f）The game finishes after 30 turns when the Dead fock are cleared．the winner is the player earning the ！Tr ERU＇s．Note that ships in play have no value．ixte
$\qquad$

```

． －
，

## Two alien races clash in deepest space

## 3. The Pieces.

Each player commences with five pieces. These may during the course of play be increased up to a maximum of sixteen.
The capabilities of each piece are:
Start Moves Attack Defence Jumps Cost Prod

|  | Start <br> with | Moves | Attacks <br> Factors | Defence <br> Factors | Jump | Cost <br> (ERU) | Prod |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Stargate | 1 | 0 | 2 | 2 | 0 | 0 | 3 |
| Batleship | 2 | 3 | 4 | 5 | 2 | 5 | 0 |
| Mner | 2 | 5 | 1 | 3 | 3 | 3 | 0 |

## 4. Other Pieces.

Other pieces on the board are:
a) Clear Hex - Yellow hex. Pieces may normally only enter these hex.
b) Dead Areas - these are red hex. There are 30 when the game commences. One is cleared before each player starts his turn. The game finishes when the last hex is deared, the current player has finished his moves and all athacks are complete. No piece may enter a Dead Area. c) Beacon Stars - These are green stars. There are 10 hidden underneath the Dead Areas. They cannot be occupied until the Dead Area is removed.
d) Scavengers at Work! - this is a blue hex. It indicates where the next Dead Area will be cleared.
e) Scavenger Explosion - this is a green hex. It indicates that a scvenger has moved too close to a star. The star may be in a clear space or lying beneath a Dead Area. fi The red half hex around the edge of the board are merely decorative and do not form part of the playing area.

## 5. Starting play.

Each player must press ENTER to start his turn. He will be prompted for his move by a piece flashing. The message reea shows the status of this piece i.e.

Name of the side currently moving Name of current piece Balance of ERU's
Index number XXX
Moves XX
Attack Factors XX
Defence Factors $X X$

## 6. Moving.

The number of moves available appear in the top-right coner of the message area. To move one hex, press a number from 1 to 6 . Visualise a six-hour clock (see below). If you wish to STOP moving before all modes are erpended, press " S ". A piece must stop when it moves rex to an opponent.
ine the 7. Production.
Athe player's option, new pieces may be produced and
e. trought immediately into play. There are three restricpaints tons:
al New ships must be docked at the Base Stargate (The
(d) she at the edge of the board).
bleach Stargate has a maximum of four docks. Occupied
id Arlocks or docks adjacent to an opponent may not be used.
he me. The number of pieces for one side must not exceed sxemen.
Toproduce ships type "P" and when the number of free Sonce appear type " M " for a minership or " G " for a puship. Provided sufficient ERU's are available, the Hips will be placed in a dock. Press " $A$ " when complete.

ILLUSTRATION JOHN RIGGINS.

## 8. Occupying and converting a Star.

Occupying a Beacon Star requires both a miner and a gunship. If a gunship is in orbit around a star then a miner may be moved into and occupy the star hex. The miner and the star combine to form a Stargate.
Occupation may not take place if an opponent is in orbit around the star.
New Stargates will commence producing three ERU's per turn starting with the player's next turn.

## 9. Jumps

If a ship is in orbit around a friendly Stargate it may jump through hyper-space to another Stargate provided the destination is not under attack. Press " J " to jump the current piece. Each Stargate will flicker in turn. Press " $Y$ " if you wish to jump to that Stargate. Press "N" if you do not. Press ENTER or " $A$ " to abort the jump command.
If the distance between the two hex exceeds the maximum allowed, there is possibility that the jump may fail. Each hex over the maximum reduces the chance of success by ten percent. This is indicated on the screen.

## 10. " $C$ " and " $F$ ".

If a player decides that his turn is complete and no further pieces need be moved, he may press " C ". The computer will check all remaining pieces and look for any that are still adjacent to opponents from a previous turn.

This however is rather slow and if it can be seen that there are no potential attacks, press " F " instead. This brings the player's turn to an immediate end.

## COMBAT

Once a player has completed his moves, combat will occur. If a piece is attacking a single opponent, combat is automatic, but if two or more pieces are being attacked the player will be asked to indicate the direction of attack. Enter a number from 1 to 6.
Caicuiation of Odds.
The combat odds are based on the ratio of the attack points of both the attacker and the defender. Any pieces adjacent to the attacker but not under attack may give assistance. Their attack points are added to those of the defender. If the defender is a stargate, the attack points of any piece in orbit will be added to the defender's points. Assistance may only be given to one defender.
The Outcome.
To determine the outcome of an attack, take the higher number, divide it by the other and round it down. The resulting number will indicate the column to be used in the table below. If the defender's points are higher, use the left side. If the attacker's are higher, use the right side.
The computer now selects a number from 1 to 10 and selects the appropriate row to obtain the result. Odds greater than six mean automatic elimination. If as the result, the defence factors fall to zero or below, a piece is eliminated.
Examples:
(1) The attacker's points total 10 points; the defender has 4 points. 10 divided by 4 gives 2.5 which is rounded down to 2. The odds therefore are 2-1 in favour of the attacker.

Runs a Dragon in 32K

Assuming a dice roll of 8 , the outcome is 4 -the attacker loses two points.
(2) The attacker's points totals 3; the defender's total 10. This gives odds of $3-1$ in favour of the defender. A dice roll of 3 is an outcome of 5 - both lose two points.

## DESCRIPTION OF VARIABLES \& FUNCTIONS

PL: Whose move?
Set to 0 for Blue, 1 for Red.
BX, BY: Board Coordinates.
These are set for each piece during initialisation and will change in accordance with directions given by the player.
BX and BY will always be both odd or both even numbers.
$\operatorname{See} F N O D()$ which checks this.
PXPY: Picture Coordinates.
The starting point for each DRAW command. Calculated wing BX and BY .
80; Board.
The address of the first byte of the Board. There is some waste since although the board has only 128 hex, 256 bres are reserved. This is convenient for calculations. Ahppl: Board Pointer.
This is a function which returns the address of a hex on pe Board using $\mathrm{BD}, \mathrm{BX}, \mathrm{BY}, \mathrm{UX}$ and UY. The arguments reo - points to the address of $B X, B Y$ - or 1 - points to
an adjacent hex indicated by UX and UY. FNBQ(): Contents of hex.
This function return the contents of the hex - e.g. PEEK(FNBP(X)).
W: Piece Table.
The address of the first byte of the piece table. 512 bytes are allowed allowing for expansion of NR and SZ.
NR: Maximum number of pieces on each side.
Set to 16
SZ: Number of Parameters in piece table.
Set to 12.
QQ: Index of current piece.
FNPC(): Address of parameter for piece QQ.
This is a function which returns the address of a parameter for a piece. QQ must contain the index. The argument is the byte number (see $X X, Y Y, T T$ etc).
FNMN(): Contents of piece table.
Similar to FNBQ ().

## Runs on a 48K Spectrum

In order to resave this program, type as a direct command, "CLEAR" and then "ENTER" Secondly type, as a direct command, "POKE 24449,128, and then ENTER. Finally type SAVE "BSW" LINE 1 and save in the normal way.

Sun Polyps are one of the palaxy＇s many natural phenomena．Clouds of tebe small creatures drift at the outer atmospheres $d$ planets，enriching and tucreasing it．
But planets fortunate mough to have these mi－ nte beings in orbit zound them，now find the zote mercenary elements d the galaxy eager to get Seit hands on them．
In Pirates and Polyps，it 3 your job to protect the plyps from a band of pi－ whes．
You control a scanner ad two laser bases on the ariace of the planet and zust stop pirate vessels trom destroying and steal－ ing polyps．
If both your laser bases $\approx$ the projector are hit， ben the game is lost．And tall the polyps are stolen the game is also over．
But you can collect the polyps yourself，by aiming pour scanner at one and nticing it down to earth． In order to collect a polyp or destroy a pirate ressel radar scanners at the top and left side of the vteen must be lined up Who the appropriate trgets Key＂ Z ＂will fire the LEFT laser base，key $M^{N}$ will fire the RIGHT

laser base Key＂O＂will bring the PROJECTOR into operation．

TOP SCANNER
KEY O＝LEFT
KEY $\mathrm{P}=$ RIGHT
SIDE SCANNER
$K E Y Q=U P$
KEY $A=$ DOWN
When a pirate vessel lands on a polyp it will be captured．The pirate will change to red and proceed to the top of the screen． You will lose the polyps if the pirate reaches the top
of the screen．
But a＂stolen＂polyp can be saved by destroying the pirate with laser fire．

Pirates come in four different guises，so don＇t be fooled by them．If the pirate ships cannot find a polyp then they turn and head back to earth bent on destruction．If they man－ age to hit your scanners or a laser base，it will be destroyed．

If a laser base is des－ troyed then it is not us－
able．If the projector has locked onto a polyp，then the polyp will be drawn into the projector auto－ matically，unless a pirate ship intervenes．
Laser fire destroys pi－ rates but has no effect on the polyps．The projector has no effect on pirate ves－ sels．

It＇s a hard game to win but the tactics will soon become clear when you＇ve had a few turns at polyp－ collecting．

30420 RUN

Runs on a Vic－20 in 3．5K．

Type in the first part of the program and save it before running．Make sure you do not alter anything，especially the＂load＂part of the program．
Save the second part of the program after the first and save it as＂\＆POLYPS＂in caps without a space．

When using the program，load and run the first part and leave the Play button on the cassette recorder down．
A lot of gibberish will appear on the screen which is
the machine code to be used in the second part of ti program．
When the second part is loaded，the cursor should flashing next to the word＂RUN＂．Press the return butto and the game will begin．
Do not clear the screen or change the display or tis game will crash．The game runs on a standard Vic： with $\alpha$ joystick．

## The inner workings of a software house

Software houses have had to learn their trade fast.
Two years ago, games programming companies as successiul as Bug-Byte, Psion, Quicksilva and Imagine were unthinkable. Now games soltware is big business and new soltware houses are appearing all the time. We asked one of these, Visions, to tell us about their operation, so if you send away a tape for consideration. you'll under: stand just what processes it has to go through before it finds its way into the local w.H. Smiths.

Visions was set up in West London last summer by four people with a background in different areas of the soltware industry: Sean de'Bray was previously in: volved in commercial soltware consultancy; Roz Pvitts comes from a public relations company which specialised in computer clients: John Burnham is the production director with a baekground in the audio industry and Martin Parmiter is the financial director.
They pooled their talents to become Visions and start producing games for the home markel.

Any software house is ultimately only as good as its programs so Vi sions treat theirs with special care.

The company aims to have six programmers employed when it gets into full swing, but like many other games companies, a lot of the ideas are sent in by freelance writers.

These are tested and evaluated quickly. The accompanying informa-
tion is read and the game cassette loaded on the required machine. Some games have an initial impact and the testers take to them straight away, others only become compulsive when they have been played with for a while.

Any that show promise are looked at by other members of the Visions' staff - four people usually test each game and give their comments, and they're all keen games players.

As soon as it gets the go-ahead, the team start working on whether the game needs tidying up or if there are $\alpha$ few areas which need improvement. The programmer is contacted straight away and invited down for a chat - young programmers are asked to bring a parent. The schedule of the game is already being drawn up, with thought going into a possible release date, when adverts would need to be put into magazines and what sort of artwork will be used in presenting the cassette.

On meeting the programmer, the suggested improvements are talked over and Visions try to discover if he is capable of doing these himself or whether he will need help from the programmers on staff. Does he need any additional equipment to make the improvements, are there any books which might help.

At the end of the meeting, he is offered a contract. The company pays $25 \%$ royalties but will also pay an advance if extra work is involved.

Visions' designer asks an artist in to look at the game and work on some ideas for the cassette inlay.

Presentation of the cassette is an important factor in how it sells so a great deal of thought goes into the name of the game, the images which appear on the cassette packaging
and how it will be represented advertisements.
If the formula is right, the con pany can end up with $\alpha$ top-selling cassette, finding its way into 15,000 homes.

## How

Visions put great stress on the wayc freelance programmer presents hir games cassette.
The more information they have the quicker Visions' testing and pro duction team can go into action.
Professional presentation can tel. long before the games tester ever loads the cassette. One obvious rt quirement is to make sure you in clude your name and address ande phone number if you have one.
Explain what machine your gam works for, whether it needs memon expansion, joysticks or any specia cartridge to run.
Give its title, a brief write up as what kind of game it is and a rus down on the key controls. Full its structions should be included.
Is it written in Basic or Machise Code and what other machines might it be possible to transfer the game to?
Have you sent the game anywhen else and if so, is it on offer?
Before the tape goes in the post check that it loads, try it on mort than one tape machine. Now it's time to include some personal details Give your age if you're still at school, add a biography of your computer experience and (if you think it will help) where the ided for the game came from.
Your prize game may still not find its way into the shops but now you have at least given it every chance.

The tips on Atari presentation come courtesy of English Software.

Simon Hunt is the programmer giving you the benefit of his knowledge of the Atari machine. He is responsible for the jewel in English Software's collection, Diamonds.

Diamonds is written in purely machine code, but Simon has reproduced the title sequence in Basic and uses it to illustrate a number of techniques which you can adapt to your own programs.

Variables used in the listing
REGBKGD, REGDIAM. REGBKG2, REGNAME, REGTEXT: These define the addresses of the colour registers corresponding to the colour of the background, diamonds, author's name, and the other text.
COLBKGD, COLDIAM, COLNAME, COLTEXT: define the actual colour value.
LABEL is used to read some of the Data: I have appended labels to the ends of data statements to show what the data is.
RAMTOP defines the register which points to the top of usable memory.
CHBAS defines the register which points to the beginning of the character set table.
SETP points to the area of memory IK below Ramtop: this is where my new character set will be placed. SETMEM is the actual value of the first memory location in the new character set table.
CHAR controls the input of the 44 re-defined characters.
BYTE controls the input of the eight bytes which define each character.
DATA is used to read in the data values.
I is Just a general variable.
DLIST defines the memory location at the start of the display list.
DLISTP, DLISTP +1 define the registers which tell the Atarl where to find the display list.
DELAY is used to control the speed at which the colours change.
Figure 1: Bit values of a

The success or failure of any programme usually depends upon its "POP". This stands for Presentation, Originality and Playability and I be-

lieve Presentation is the most important consideration of the three. In this listing below I'll start by showing how the colours are set up between lines 600 and 720.
Register 708 is colour register 0 ; register 712 is Colour register 4. The values of any combination of hue and luminance can be calculated by multiplying the hue value by 16 and adding the luminance level. This value is them poked directly into the colour register. So SETCOLOUR 1.4,8, can be replaced by Poke 709, $4^{*} 16+8$ or Poke 709,72.
Note that in Graphics mode 0 colour register 2 (location 710) defines the colour of the background, but in graphics modes 1 and 2 , colour register 4 (location 712) defines the background colour.
Since the title page uses modes 0 , 1 and 2 all at once, registers 2 and 4 have been set to the same colour to keep the background uniform; registers 0,1 and 3 define the colours of the Text.

Lines 1000 to 1100 load in the character set.
The Atari's default character set is stored in 1 K of ROM starting at location 57344. The register CHBAS (756) points to the first page of the character set data, (a 'page' is used to describe 256 bytes of memory). At power-up PEEK (756) will return the value 224 since $224^{*} 256=57344$. If we POKE CHBAS with a different page number (in multiples of four) the Atari will use the data in the following 1 K of memory to display the characters.

Now each character is displayed as an $8 \times 8$ grid. Each row of pixels is defined by one byte of data and where the bits are set to 1 in the byte, the corresponding pixel in the character will be lit.

So each character is defined $b$ eight bytes. The first byte is the tof row, the last byte is the bottom row. The bit values are shown in fig 1 to calculate the value of the byte add the bit values together. (A ror with the end bits lit has the value $128+1=129$ ). These bytes are arranged in the character set table as shown in figure 2.
Programme lines 1060 to 1090 load the character set data into RAM $\mathbb{1 8}$ below Ramtop while line 1100 act: vates the new character set.
Lines 2000 to 2040 load the title page data.
The area of RAM used to store the data telling the Atari which charae ters to display on the screen, is loco tion 1536 to 1755 . This is part of page six (page six runs from 1536 to 1791 ) The rest of page six will be used to store the display list.
Page six is an area of RAM which is not used by Basic or the operating system and so is free to be used by the programmer.

The display list is set up betwees 3000 and 3090.
It is $\alpha$ list of instructions which tell the Atari the types of graphics mode lines to use for a screen, and where the screen data may be found it memory.
When you execute a GRAPHICS command in Basic, an area at the top of RAM is cleared and used to store the screen data, and a display list is generated just below this area to define which mode lines to use is displaying the data. GRAPHICS 0 produces a display list that defines 24 mode, 0 lines. GRAPHICS 1 produces a display list which defines 20 mode 1 lines than 4 modes 0 lines for the text window.
By choosing the right instructions we can write our own display list to create whatever pattern of mode lines we require, remembering that the size of the screen must never exceed 24 mode 0 lines of 12 mode? lines, or the equivalent.
A 'SCAN' line is the name given to a line 1 pixel high. So a mode 0 line is eight scan lines high; a mode ? line is 16 scan lines high. Thus the maximum number of scan lines in a display is $24^{\circ} 8=192$. My Display list is structured as shown in figure 3.

The Seventh Empire is dominated by the BloodIne race, a tyrannical regIne headed by hereditary diones. They alone control the 'greenhouse effect' Flanets, those rich in stelar energy - energy espeseful for interstellar rivel. And interstellar travel means power.
Bloodline Scientists tave developed a theory tiat "greenhouse effect" panets are created by Polyps" - small organsms that are the nomads if space. The theory holds trat if a new generation of flyps form on a dead fanet, their activity turns tover a period of time, to a greenhouse effect danet. The time scale for Nis process is estimated 120 years.
The Bloodline Empire tore therefore chartered a pace exploration vessel, - Vespozian, skippered - Captain Bezel from the Firate Empire, to investifate the Funus solar systm to test their theories. On board The Vespozian D'taan, a female human vientist, charged with the siponsibility of conduct-

Dian is ambitious, and vould risk a lot to gain witrol of a source of stelE energy.
However, to do this, she pould need to break free on the influence of the Boodine Empire, by Witerating the Bloodline Prigate currently stawed in the Funus SysIn, and to which the

## Scenario

 Wigen and Bulgen.
## 2 Mission

 wowledge or help from Captain Bezel.

D'Taan felt sure someone was watching her
Vespozian is now returning at the end of its voyage.

Nearing the end of its journey, Vespozian is low on fuel. Each change of course uses 100 picaroth of fuel, and Vespozian's only weapon, a laser cannon, uses a massive 1000 Picaroth each time it is fired.

D'taan is uneasy. She is convinced that there is a Bloodline spy aboard.

In "The Vespozian Affair", you become the cautious D'taan.

To play this Adventure, enter 1 -word or 2 -word commands when prompted by "WHAT NOW?". Bear in mind that to move to a different location you must always use the verb "GO" followed by a direction or location. And be careful - I think you're being followed...

## SEVENTH EMPIRE <br> ADVENTURE NOTES

loard the Vespozian heading through the Funus system tgointo orbit around Gyrates, and there to dock with the Boodline Stargate, also in orbit aound Gyrates. As the pme starts, the Vespozian is between the orbits of Great
$b$ bbliterate the Stargate using the Vespozian's laser rapon. As D'taan, you must do this covertly, avoiding ispicion by the Bloodline spy Grakta, and without the

## 3. Game Description

This follows the usual Adventure format, but breaks out this mode for control of the ship, and view of the navigational details.

### 3.1 Navigational Details

These are reported on a screen in the Navigation Room. The screen is not visible from "Adventure" mode, but a "LOOK AROUND" clue mentions the screen. "LOOK SCREEN" will display it. Details given are:-

## CLONE-YEAR

ZONETIME
CURRENT BEARING OR ORBIT OF VESPOZIAN
ETA AT BEARING (IN ZONETIME)

## FUEL LEVEL (IN PICAROTH)

LASER OPEARTIVE OR INOPERATIVE

- Note that 1 clone-year $=200$ Zonetime. 1 Zonetimes $=$ 1 player's command.
At start, the fuel level is 600 picaroth. Picaroth is the energy unit, and usable as follows:-
To change ship's course - 100 pR
To freeze crew cryogenically - $10 \mathrm{pR} /$ Clone-year
To fire laser - 1000pR

### 3.2 Control of Vespozian

Normally from Bridge, where LOOK AROUND clue says "Button marked Thought Control". Pressing button is impossible, as player is restrained by Machen, the pilot.
A metal lined gangway near the door of the suit room, reveals via "LOOK AROUND" a hidden bulkhead which can then be entered. It contains a duplicate control. No button is visible, so the player must deduce there is a button from his look at the Bridge. Pressing the button puts the game in "control mode" eg:

A THOUGHT IS FRAMED IN YOUR MIND
HEADING, CRYOGEN, LASER or END?
To change the ship's direction, a touch of the " H " key will cause the current location and heading to be displayed, and a request for new destination.
The reply is validated against known planets and stars, and against the current fuel level. If OK, the course correction is applied and confirmed, and the fuel decreased by 100 pR .
As the ship passes each planet, between moves, the screen is cleared and:

## RUNS ON A BBC MODEL B．

## CONVERTED BY STEVE WILLIS

The display of the BBC is far superior in the Teletext mode （MODE 7）and of course the BBC has its very flexible sound options．It is in these two areas where the BBC translation has been enhanced，using a set pattern of colours for the displays with＇meaningful＇（1）sounds．
Because space is tight on the BBC，especially when a large number of string arrays are in use，I have adopted a space saving way of inserting coloured displays．

This does require some work and the method for a machine with a 0.1 operating system is more complicated．
in order to use the listing provided，colour is not needed but mods will be required in the DATA strings（lines 1520－1580）． Where I have shown words highlighted in yellow the words should be omitted and 1 space inserted inslead．To use colour then the word must be replaced by its respective colour control character instead of a space．Following is a list of colour control character／keyboard equivalents：－

| DIV | RED | 1 | A |
| :--- | :--- | :--- | :--- |
| EOR | GREEN | 2 | B |
| MOD | YELLOW | 3 | C |
| OR | BLUE | 4 | D |
| ERROR | MAGENTA | 5 | E |
| LINE | CYAN | 6 | F |
| OFF | WHITE | 7 | G |
| STEP | flashing on | 8 | H |
| SPC flashing off9 |  | I |  |

On the 1.0 or later operating systems these can be inserted using the shift + a function key（where the function key number is the number in the 3 rd column above）．On 0.1 systems the function keys must be programmed using commands such as ${ }^{\circ}$ KEYI IIIA to give red；the remaining keys are as in the 4th column above，e．g．＇KEY2 IIIB for green．

Please note however that，once typed in，listing these DATA lines will display the keyword and not the colour．This is fine as long as you do not edit any part of the line．If you edit a DATA line showing keywords then every keyword in that line must be replaced by the colour again．

For the strings in the text colour control display lines．These can be inserted between the first＂and the first character of the string．The string will then be displayed in colour during listing as well as running．A spinoff is that the remainder of the listed line，after the end of the string，will also appear in colour to the end of the display line；this does not have any bearing on the operation of the program．

＂You traitor＂，yelled Grakta，lashing out

Giving your Dragon games a professional look are two of Salamander Software's top programmers.

Writing under the obscure title of Nat and Franklin are Peter Neale and one of Salamander's other programmers who wishes to remain anonymous.

Peter Neale is Texas-born and has been involved in computing since high school in the States, where he learnt most of skills by playing Star Trek on a remote teletype link to the University of Texas computer.

He arrived in England in 1974 to attend the University of Sussex and then spent four years as an IBM mainframe programmer, two years as an accounts programmer and two as a system programmer.

Finally he quit to set up Salamander Software with wife and friends in November 1982. He has $\alpha$ hand in designing most of the company's titles and was responsible for Dragon Trek and Wizard War.

Franklin claims to have been raised on Betelgeuse V but his Earthly programs include: Grand Prix, Starjammer, Gridrunner and Franklins Tomb. He is currently working on the sequels to Franklin's Tomb and the first will be called Lost in Space.

## Taming the Beast

Having spent many hours in the high street Jungle, you finally managed to cage yourself a Dragon. But now that it's locked up in the back room, what do you do with it?

Feed it human sacrifices on the full moon? Not if you want to keep your friends.

Subject it to the whims of other Dragon Masters? This can provide hours of harmless amusement.

But what you really want to do is to become a Dragon Master yourself, learning to tame and control the majestic beast. There is only one way to do this. Start writing programs.

There is one thing that can turn a good game into a great game, presentation. A player's first impression of a game is based almost solely upon what he sees, and this will greatly influence the player's final

judgement.
A cluttered screen, badly presented with difficult to readinformation, or boring graphics, can turn a player off, and he may grow to dislike what would otherwise be an excellent game.

The hardest and possibly most misunderstood aspect of presentation is printing. If you bought $\alpha$ book you wouldn't expect to find words split haphazardly, crooked margins and spelling mistakes.
Neatness does, after all, count. When you are planning your program, lay all the text out on a print grid like the one in the Dragon manual. Centre the text in the middle of each line or insert extra spaces to make the margins even. It takes more time, but the results are worth it.

To further improve the appearance of your text, try printing everything in a greenbox on a coloured back ground. This technique is particular ly effective. When printing columns of numbers, use the PRINT@ and the PRINT USING so the text is printed exactly where you want it. Using the semi-colon (";") in your PRINT state ments allows you to print on any line without destroying the rest of the line. Use all these techniques together and you will find that you program will begin to take on a pro fessional appearance.

It can be very useful to POKE characters directly onto the screen in stead of printing (the text screen is located between addresses 1024 and 1535). Sample program 1 shows you how you can get the complete ASCI characters set inverse video. The is verted alphabet is available normal. ly by pressing Shift and (@). Other characters (e.g. \& and \%) can only be inverted by POKEing the correct values directly onto the screen. $A$ particularly useful location is 1535 the last screen position. If you printe character at this location, the screes will automatically scroll up, but if you POKE the character in, you con avoid this.

The low resolution graphics on the

Yagon tend to be vastly under-rated ad generally pooh-poohed by peo4. Don't make the same mistake. The great advantage of the low-res Faphics is that you can get all nine flours and text on the same screen. Using the low-res graphics, you = put borders around text (as in imple program 1), put simple zimation in instructions (always a rimer), or they can be used to great
effect in title pages. Sample program 2 is an example of the latter, where the X and Y co-ordinates, which are to be set on, are stored in DATA statements. As each position is set on, the impression of writing is given.
There's one thing to be careful of when using the low-res graphics, each character position is divided

into four pixels. Within one character position, you can have only one colour and black, so be sure to plan well in advance.
High resolution graphics are a different kettle of fish indeed. The number of different ways of displaying anything on the hi-res screens
could fill $\alpha$ book. The best way to fully appreciate the hi-res graphics is to sit down and try different things out. The DRAW command is especially powerful. By setting up a few DRAW strings at the beginning of your program you can very easily create animation effects. The only thing to be wary of is DRAWing off the edge of the screen, as this will distort your picture. Sample program 3 illustrates both the DRAW command, and the effects you can get using FOR/NEXT loops. The expanding CIRCLE used for the explosion could be easily changed to look like an approaching tunnel or planet.
Treat your Dragon with respect and it will be a true and loyal friend.

## Notes on sample 1

## Lines 10 - Clear screen

$20-50$ - Draw box on
60 - Fill box box on text acreen
70-100 - Print menu chotine
110-150 - Print menu choices
160 - Fill box option to be selected
180.250
for character to screen and wait for key press, then put another
$260-270$ - character on etc.

Runs on a Dragon 32 in 9K with one joystick
lially and any, all or none of the dice may be thrown or sued on subsequent throws. Jp to three throws are allowed ${ }^{6}$ achieve any desired comHination. One problem in computerising Yahtzee is the number of inputs needed for savigg, throwing and deciding which combination to choose. It
would be easier in most cases to just throw the dice and forget the computer! The author has got round the problem beautifully by utilising the right joystick as cursor control. This clever trick has enabled hi-res displays of the dice and very easy inputs. All instructions are included.

## Variables.

D(1)-D(5): array to store dice. $\mathbf{P ( 1 ) - P ( 5 ) : ~ a r r a y ~ t o ~ s a v e ~ d i s e . ~}$
SC (C, CH): array to determine whether a player, $\mathbf{c}$, has used a certain option, CH.
Name $S$ (C): array to store names of players.
TTAI (C): array to store scores of each player.

It's a well known video gamers' maxim that the tough ones are best.

Whilst agreeing with this wholeheartedly there is always a time in every gamer's life when a little assistance, or hint, is more than welcome.

The C\&VG review team have been busy over the last few months playing their way to the bitter end of some of the toughest games you can get for the popular video games systems. Here are their reports, hinest games around.
highly on some of the toughest games around.

## PTIFALI FUN IN THE JUNGLE!

Pitfall was one of the smash hits of 1983 and voted Game of the Year at the Consumer Electronics Show which is America's Chelsed Flower Show of video games, where all the major manufacturers show off their prize exhibits.

Pitfall Harry's Jungle Adventure takes you on a perilous search for the lost treasure of Enarc.

On your search you will encounter many dangers in the shape of crocodiles, snakes, scorpions, logs, and disappearing lakes.

You have just three lives and twenty minutes to locate all the Treasures of Enarc.
Control of Harry is simple. All you do is push the joystick in the direction you want him to move - right, left, or up and down the ladders that connect the two floors. Pressing the fire button makes Harry jump which is the way he avoids obstacles.
The nasties have different strengths and some of them are easier to avoid than others. Generally timing is the key to overcoming all of these obstacles, time your run and leap to the split second to get over them.

The other general tip is to keep a record of the screens that you visit, try to memorise them and note down all the obstacles that appear on each screen.
The first screen is easy, simply skip Harry across a stationary $\log$ and one hole and your are on your way to the next screen.

The first major hazard appears on screen three in the shape of a bog. Hop on to the vine - timing your leap carefully - and jump again as soon as you land on the far side of the bog to clear the log rolling towards you.

Toughest of all the jungle adversaries are the crocs. The only way to get across a croc infested lake is to use their heads as stepping stones. There are two ways to deal with the crocs - the slow safe way, and the fast risky way.

For the more cautious of you there is a safe spot at the back of each crocs head where you are out of reach of those snapping jaws.

Daredevils may wish to attempt the fast method time your jump so that Harry's last footstep on land takes place just as the crocodiles mouths begin to close If your timing is sharp enough you should be lable tod clear all three crocs in three quick hops.

A couple of easy obstacles follow the crocodiles and it is not until screen seven that you come across your firsh piece of treasure.

To claim the gold bar you must successfully negotiate a disappearing bog. The secret of getting past this a obstacle is to position Harry in the space between the second number and the colon on the timer. When the bog begins to disappear make a dash to the right. This strategy is the best one to adopt for all diasppearing i bogs on other screens.

These tips if learnt thoroughly should enable you to $t$ deal with all the obstacles you encounter in the follow. ing screens.

For real speed in Pitfall you will have to learn when and where to use the underground tunnels. These take you through the jungle faster but be careful not to miss out on the treasure as well as the obstacles.

## HACHCHACHA1A14

## OUEST FOR THE RINGS

Quest for the Rings represented $\alpha$ totally new concept in games when it was launched last year.

The first ever board game come video game all in one. The theme is very Tolkienesque with demons, dragons, hidden rings, and strange powers.

The ided of the game is to find the 10 rings that have been hidden by the Ringmaster. Two people can play as $\alpha$ team against the forces of evil or there is also $\alpha$ single, player version of the game.

The video part of the game is basically a maze chase affair. The various screens for this action are selected, by pressing the keys on the overlay giving you variously; The Dungeons, The Crystal Caverns, The Shifting Halls, and the Infernal Infernos.

Matching of partners is the key to success in the Quest. Pick partners that work well together, one to deal with the enemy, the other to dart in and grab the, rings.

You can choose to be a Wizard, Phantom, Changeling or an Alien.

Each has different powers. The Warrior is armed with "Theor's Sword" which can slay adversaries that come at you on a horizontal plane only. The sword is useless if the creatures attack from above or below.

Wizards can cast spells which have the effect of temporarily immobilising enemies.

Phantoms can walk through walls and Changelings can become invisible altogether though both only move at half speed when in this state. Practising each of the four roles is the key to mastering Quest for the Rings, on the Philips G7000.

## SURGERTIME - FAST FOOD!

Wall the food games that have appeared since Pacman, Aigertime must surely be the best.
Ifs fast food at its quickest as you score points in an tempt to assemble four hamburgers before the peppers, hogs and sausages catch you.
Burgertime is a master strategy maze game. You have plan your, route very carefully. Unlike Pacman you -nnot go on long sweeping runs gobbling dots - as in is game it's not just simple dots and slow ghosts that pout to get you. Those pickles are really mean and the dy defence you have against them is $\alpha$ limited supply of epper.
Extra pepper can be earned by catching the tankards of her and cartons of french fries that appear periodically. The secret of success in Burgertime is to get the pickles follow you, position them under a burger, lettuce leaf foun and then splat - drop the morsel on their heads Fd send it crushing to the ground.
One tip for dealing with fried eggs is to turn and walk vay from them once they have been peppered - don't palk through the points that appear, as this will cause eggs to reappear.
As you move your way up through the screens the Hout of the burgers gets more complex and you will ped to think even harder about the route to take.
One of the most dificult parts of Burgertime is learning control the chef with the disc controller and it may pay Ito spend an afternoon just steering the character pund the screen to practice tight cornering.
Go - gorge yourself.

## AIDERS OF THE LOST ARK

is just too damn tough was many a gamers comment Howard Warsaw's adaptation of the Stephen Spielarg blockbuster - Raiders of the Lost Ark.
The 13 screen of action with their assorted challenges ad many of you stumped.
t you were one of those people, then help is at hand. A if you want the satisfaction of getting there for parself then turn the page right now.
You are Indianna Jones - the hero of the game and In in search of the Lost Ark of the Covenant.
The game begins in the entrance room which shows ma, a snake, and the famous whip. Pick up the snake $2 d$ dash down screen to the market place before the cake gets you.
Once in the market place you must now assemble the zes you will need for your adventure.
tiems are picked up by moving Indy around the screen nd simply touching the item you want. Get the magic fie first as this will give you immunity from the etkes. Also pick up a grenade, a key, and an eyepiece =
Once these items are registered at the foot of the creen you are ready to enter the Temple of the bcients. To do this you must blast $\alpha$ hole in the side of 9 entrance room with your grenade.
This needs to be a quick, clinical operation as once ba have selected the grenade you have lost immunity mat the snakes.
You will also have to remember to dart back to the
market place before the explosion takes place otherwise you will be blown to bits as well.
Pick up the timepiece in the Temple of the Ancients and head straight for the Blue Room - also known as the Room of the Shining Light. You will now find yourself trapped in one of the cells at the bottom of this room. This is your first opportunity to select the whip and blast a hole - Breakout style - in the wall of the cell.
Once you have escaped make a dash to the right towards the Treasure Room. Items to pick up here are many and the Egyptian Ankh - persistence is required to win the latter as the Gods are reluctant to part with such a valuable item easily.

You shold now have in your possession the Ankh, two bags of money, the time piece, and the eyepiece. Go back to the Blue Room and get yourself trapped in one of the cells. Select the Ankh, press the button, and hey presto you are teleported to the Mesa Field.

From the Mesa you must find your way into the Map Room. The map will appear at the centre of the screen. Centre yourself on the map and move the selector dot to the timepiece and press the joystick fire button.
This will make the clock appear. Just before the hands of the clock are vertical select the eyepiece.

The sun will now flood in and if you look carefully through the eyepiece at the map you will be able to see a tiny flashing dot - in one of the mesas - this is the location of the Lost Ark of the Covenant.

So now you know where it is the next step is to go to the Black Market and buy a shovel which you will need for the dig.

Take the right exit from the Black Market and head for the Treasure Room - you will now need to recover the Ankh to take you back to the Mesa Field, and two more bags of money to buy a parachute.

Use the parachute to arrive in the Mesa - you are now very close to finding the Ark and to give you further help would only spoil the last most exciting scene of the game. Go to it Indy.

##  <br> CENTIPEDE-INSECT ATTACK!

Fun in a mushroom field can mean only one thing to video gamers - Centipede.
This arcade game caused a real wow in the arcades as it was the first game to demonstrate the full potential of trackball controllers.

The key to success in Centipede is to fire quickly and fire accurately.

Beware of low lying mushrooms as the Centipede moves down a row when it collides with a mushroom.
The secret is to clear just the right number of mushrooms - don't clear all of them as if you do fleas will begin to appear. You must learn to look at mushroom configurations and act accordingly. If a formation of mushrooms is enabling the Centipede to fall rapidly through a certain part of the screen blast them away to slow it down.

Not all mushroom formations are dangerous - some of them can actually be a bonus. The best example of this is the funnel formation in which the Centipede has to travel through a tunnel of mushrooms to advance down screen. If you position blaster in just the right position at the foot of the funnel you can completely annihilate the Cen-

Large scores can only be picked up by blasting the spiders that drop out at you every so often - to score really highly let them get quite near to you before you let fire.

This policy can be a bit hairy in the later stages of the game when the action is much faster.

Centipede is a game of priorities - always pursue the highest point scoring possibility on the screen at any given time. Go for all the spiders, scorpions, and try to shoot the heads off the Centipedes.

One tip for getting Centipedes that are near to the bottom of the screen is to position yourself at the very bottom of the screen with one mushroom one row above you - when the centipede head comes in between let fire with all you've got - the rapid fire created by the mushroom and Centipede sandwich will enable you to blast the whole thing segment by segment till it is completely dead.

Be adventurous, take risks, and assert yourself.

## DEMON ATTACK - TOUGH ALENS

Demon Attack is arguably the toughest shoot 'em up type game available for the VCS.

No less than 84 waves of aliens are queueing up in this cartridge to attack your laser base.

This is the hybrid of two arcade games - space invaders and Phoenix, though unlike the official Atari Phoenix does not have the home base.
The basic strategy is similar to invaders - slide and shoot.

Keep constantly on the move thus preventing the aliens from cornering you.
Pick off the low flying aliens first. If you kill these you may notice that the higher aliens flap around the screen harmlessly without firing back. You can now pick these off at your leisure.
There are 10 game options in Demon Attack. You can choose one or two players, regular or advanced aliens, and whether or not to have guided missiles.
If you are playing the guided missile variation, be reminded that the laser base moves together with the missile so you must be careful not to guide your base into an oncoming missile as you pick off the aliens.
Speed and good hand-eye co-ordination are crucial to success in Demon Attack.

## BY STEPHEN GODFREY

## RUNS ON A TI 99/4a in 16K

The baffling corridors of mazes seem to have a certain strange fascination for our readers. Maze games have become firm favourites with you funny people out there! So by public demand we bring you more mind-boggling frustration.
Stephen Godirey took a look at the /3D Maze game we printed for the Sharp MZ-80k in our Book of Games earlier this year and came up with a conversion for the TI 99/ 4 a .

Rll you have to do is find your way through the maze and discover the exit. Sounds simple, but just try it!

You'll soon be tearing your hair in great
big lumps - we guarantee it! But never mind Stephen has come up with $\alpha$ cure for premature baldness.

Stephen has also included an ingenious "cheat" command but you'll have to play the game to find out just what that does for you. Other, more standard controls, are; "L" for left, "R" for right, " $M$ " to move forward and " $F$ " to turn 180 degrees.

## Program notes

To make your life easier type in lines 14 to 27 first and RUN. Then substitute the characters shown below - where they occur - with the given keystroke. (Note: This will be different if you have a TI 99/4.)

 14. PRINT "

Licensing video games is a marketing man's dream. Theory and imagination meet head on as the most unlikely titles, characters, and products are "tied up" at enormous cost to be converted into home video games.
It all started with arcade games. It was an obvious step for the home video games manufacturers to license the title of a popular arcade game and convert it for home use.

Gamers now take for granted that successful arcade titles will eventually be converted for the home systems. But just five years ago it was thought very innovative when Atari introduced home versions of Space Invaders and Breakout for home use.

Now any arcade game which produces the slightest tremour of popularity in the arcades is leapt on by the large firms licensehunters.

Many games are tied up even before they go into the arcades, just in case they are hits.

Licensing has been the salvation of the arcade game manufacturers many of whom receive millions of pounds for their games.

Of course this has its bad side as well as its good side and many people in the arcade business believe that quick conversions to the home are killing the revenues of the arcade proprietors.

Whatever the effects on the arcade industry these games are key targets for the home game manufacturers.

Parker Brothers spent four million dollars each to get Popeye, Q'bert and Tutankham and expect to have to pay at least this in the future for good titles.

Colecovision could not quote an exact figure for licensing arcade games because the deals they make are usually tor more then one game. One thing is certain though - with two of the hottest titles of the year in the shape of Zaxxon and Donkey Kong the sums involved would, as with Parker Brothers, be

## How your favourite heroes are turned into your favourite <br> games. By Eugene Lacey

measured in at least six figures.
Atari are in a slightly more favourable position than some of their competitors as they have their own arcade division.

This means that they already own the rights to several hit games, Centipede, Pole Position, and Xevious to name but three.

Fortunes are made on the rights to arcade games but even larger fortunes are made on the rights to films.

Mattel Electronics were the first company to produce a home video game based on a popular film release - with their Tron games for the Intellivision.

Their deal with Walt Disney also enables them to produce games based on some of the Disney cartoon charaters.

Atari followed into films in a big way last year with a 25 million dollar deal with Stephen Spielberg which enabled them to produce both ET and Raiders of the Lost Arle games for the V.C.S.

The list of game-of-the-film titles is now a larger category than sports simulations.

Like all so-called comprehensive lists I've probably left something out. However, here are all the video games, some of which are not available in the UK, based on feature films.

ET, Raiders of the Lost Ark, Jedi Arena, Return of the Jedi, The Empire Strikes Back, Superman, Spiderman, M.A.S.H., Tron Deadly Discs, Tron - Maze-a-Tron, Tron - Solar Sailor, Buck Rogers,

China Syndrome and James Boni 007.

Before you read this there will probably be half a dozen othe films announced for the vides games treatment.

Although several films have not been converted by far and away the most expensive must surely be the Star War games.
The exact details of Parker Brothers deal with George Lucas the director of the Star War films, it not known. We do know that Parke Brothers have the rights to produrt all sorts of games and toys based on the films

There will be dozens of Star Wand toys in the shops this Christmas from large plastic Millenium Fob cons, models of R2-D2, C3-PO ans Chew Baca and the video gamesof which Parker already have threet with one more in the pipeline.

Unlike Spielberg, who received his money "up front" from Atari Lucas earns a percentage of thr profits of all the Star Wars toys.

Blockbuster films are by H means the only areas being lookef at by the game license hunters.

Anything which has popula awareness, particularly amosp young people, can be turned into s. game.

The Americans band Journey re cently became the first pop groupt: have their own video game and at likely to be followed by Devo a number two. Come on Duran Dure let's have the first British groupl video game.
Television programmes are als being looked at and in America firm recently advertised a Dukes al Hazard game, which should ius beat Atari's Muppets game on th the shelves.

We have probably not ever scratched the surface of video and computer game licenses.

One clue to what to expect in tiris future is a game recently gone a sale in America with the charming ly ridiculous name of Attack of tis Beef Steak Tomatoes.

## YU/A

## SNACKBITE

Cyril, the word-eating snake, takes his daily, meal by leaving his lair and wandering along the tunnels which connect the chambers of his den. At each chamber he takes a bite
 $W^{* \cdots \cdots}$ s first toddler micro should be accompanied by software of a regal and loyal nature.

In his version of Munchyman, the dots are coloured Red, White and Blue and the patriotic little gobbler always eats the dots in that order, Blue being followed by Red again and so on.
Once a dot has been visited it cannot be used or passed through again and the task is to consume as many dots as possible before becoming stuck.
From any dot you can only move to $\alpha$ neighbouring dot - i.e. one you can reach without passing between two other dots. Starting from the Green dot at the centre, just what is the longest path you can find?
For family fun, place a piece of tracing or thin paper over our picture and draw on that, then everyone can have a turn.

PUZZLING SOLUTIONS ON PAGE 128

## INTO

 THE
# FUTUR 

Imagine your ideal game with graphics that leave sothing to the imagination.
It comes to your home where you sit alone but can play against other people sitting in their own living noms.
It has stereo sound and the exploions actually rock your chair.
It may be science fiction at the soment but it will be happening ery shortly. All of the technology is tready here and it won't be long seore someone packages a game which puts you on the inside with be action happening around you.
The most important development laser disc games. The next gensation of arcade games will feature aser disc technology with film acfon reacting to the player's movesent and firing.
Already a game called Astron Belt in UK arcades, showing what is pssible on laser disc.
Astron Belt puts a computer paphic ship in front of a film backpround, which comes from $\alpha$ spanese science fiction film. The rackground consists of planets, fars, alien ships and alien landkapes and when the computer regsters a hit on an alien craft, the reen dissolves into $\alpha$ bright orange aplosion.
The game has plenty of flaws but bese should be corrected and imyoved as the manufacturers underand the medium better. The main troblem with laser disc is interrupfon in the game action.
This is due to the speed at which the laser can search appropriate tenes and sounds called for by the Anyer's response.
One way around the disc response me is to store the information in an fificient way so that it follows the
game's logical sequence. Another more expensive way is to use a double disc system so that one disc follows the current action while the second prepares for the player's next move, providing a "seamless" picture. A laser disc cabinet costs about $£ 2,000$ but it is easily re-usable with a new game disc.

Other examples of games using this technology are: Dragon's Lair and Eon and the Time Tunnel.

Dragon's Lair is a fully animated sword-and-sorcery cartoon with the player taking the part of Dirk the Daring. He swashbuckles through a castle loaded with scorpions, snakes, trapdoors and pools of fire.
Eon and the Time Tunnel is a similar fantasy theme but the player travels through a series of movie scenes featuring ominous Welsh castles and futuristic cities.

Astron Belt also features the vibraseat. A chair which shakes and vibrates in time with the action, so those explosions can really rock you to the core.

Another arcade breakthrough is in allowing players to take on each other as well as the computer. A Californian company, Simutron has just produced the Simulator game system which allows up to 16 players to interact on one tournament centre.

Each player is sat in a cubicle with up to four screens of action in front of him. The first game using this system is called: Star Trek: The Motion Picture (not to be confused with the
current Star Trek game going the rounds in arcades).

A player has four screens of information, showing tactical displays and laser disc film from the movie Star Trek. It has a hundred buttons, voice synthesis and stereo sound. If he wants to compete against $\alpha$ friend, the other players' ships appear on his screen as rebel fleets.

For the future they plan a sports simulation, a fantasy game and games based on other popular movies. The system can also be connected down a phoneline to other similar centres allowing a nationwide or even worldwide tournament.

In the U.S. they are already doing without the phones, using cables. The system is currently limited to a small audience served by PlayCable, a New York City-based firm, half-owned by Mattel. This winter will see the launch of the Games Network of Los Angeles and three other companies (including Atari) are exploring the possibilities.

PlayCable offers subscribers (\$15 a month) 20 video games which change every month. The system can only be used by owners of Mattel's Intellivision System and games are downloaded into the system in about 10 seconds.

Games Network will place a microcomputer in the subscribers home for $\$ 50$ (about $£ 35$ ) and then it's $\$ 14$ a month for 20 games, including some arcade hits.

It's all just around the corner.

Behind the quiet facade of suburban homes all over the country something strange is going on. In the quiet cul-de-sacs and peaceful treelined streets of towns and cities you'll find ordinary looking homes which hide a secret known only to a select few. Venturing into this secret world takes you on a nostalgic journey - but if the secret gets out then the residents of these houses may have already discovered the shape of things to comel
Keith Temple, who lives on the outskirts of London, near Croydon, is one of the
 he isn't the only one.

few. The back room of his house is an Aladdins' cave of arcade memorabilia with pride of place given over to two veteran pinball machines. All bumpers, bells and bright lights these machines are Keith's pride and joy. Along with four other pins and a magnificent 50's style juke-box that is! Keith is just one of the 300 or so members of the Pinball Owners' Association which has kept the art of playing the silyer ball alive during the lean years of the video boom. Now the game which grew up with rock ' $n$ ' roll and the Cold War is coming of age in the era of synthesised pop and cruise missiles.
More and more people are turning to pinball as an alternative to hammering the Smart bomb button on
their favourite video game. Keith is pleased to see pinball making a comeback and although he is a fan of the older machines is ready to admit the modern games are just as good. "The older machines are nice to play. but often the modern electronic pins are faster and give you a better game." Having said that his favourite pins are the "wooden-rail" machines from the 50's - so called because of the wooden strip along the sides of the cabinet.
Keith's love affair with pinball began when he was still at school in Lincolnshire. He used to nip down to the local cafe and rattle up a few high scores.

Several years later he was passing a shop in Croydon and saw a pin-table lan-
guishing in the window. I thought to myself, l've got to have that " Later, on his way home with a car full of old machinery he thought to himself: "What have done!"

But he learned of the then recently formed Pinball Owners' Association and realised that he wasn't alone in his passion for pinball. He joined up - becoming one of the first members of the fledgling association - and since then has never looked back. He became the associations' Pinball Wizard at their annual convention in 1980, beating all-comers to that coveted prize.

Although Keith has six machines he is just an average pinball fanatic. Other members take their passion even further. Some have built special extensions to
their homes to take collections of pin-tables which often run into double figures. There's a family of pinball fans who have a house full of machines and there's a rumour that one member owns an amazing 200 pins!

But what attracts people like Keith to go to such lengths to preserve these old machines and encourage interest in them? "I suppose there's a certain amount of nostalgia attached to it. But really it's the 64,000 dollar question and very difficult answer!"
Keith is an art-restorer by trade and lavishes the same care and attention on old pintables as he does on Victorian paintings.

Pinbalt has been thought of as primitive compared to the latest 3D stereo-sound video games. And admittedty many of the features you'll find on a modern pin date from the 30 's and 40 's. But pinball has made a bold step into the microchip age. Electro-mechanical machines are things of the past - replaced by chip controlled games. Some even speak to you as you flip the ball around. There are pins based on video game themes, like the Williams Defender and combined video and pinball games like Bally's Baby PacMan. All a far cry from the first pin-tables which had light bulbs to mark up the score instead of digital displays!

Pinball has also survived conversion to the small screen. Some video games centres have pinball cartridges produced for them and computer owners can also play pinball.

Tandy brought out a cartridge for the TRS-80 Colour Computer which had the added attraction of allowing the player to design his own playfield. Texas owners can also play the game.
But for people like Keith their will never be a substitute for the real thing. They'll be Pinball Crazy until their flipper fingers seizeupl
If you want to know more about pinball or the Pinball Owners' Association contact the association's headquarters at "Arcadia", 465 Cranbrook Road, llford, Essex.

Communication to Tracker Z680 ... unprogrammed android in your sector. Type: security droid. Status: control malfunction. Solution: terminate ... message ends.
Another assignment for the overworked and underpaid Tracker. A dangerous job hunting down rogue androids. You never know just what you are likely to come up against. Some of them are pretty tough customers. But then, so are the Trackers ...
These men are the bounty hunters of the 21st century. Seeking out and destroying rogue androids who get too big for their programming sequence. Now you can join the elite ranks of these modern day hunters and save the world from the dangerous androids.
The fugitive android lurks somewhere among the obstacles on your Tracker control screen, displaying the sector your Tracker patrols. The Tracker must catch the android within

18 moves or the fugitive realises it is being followed with nasty consequences for the Tracker. To catch the android the Tracker first has to work out the best route to reach his target and input them into his control computer. The complete set of moves must be typed in up to 18 - and then just hit the return key and sit back and watch.
The Tracker on screen follows the appropriate course step by step.
While this is going on a small arrow points to the appropriate instruction on the line the player has keyed in, and the move number is shown. Inputs are: $\mathrm{L}=$ left, $\mathrm{R}=$ right, $\mathrm{U}=$ up, $\mathrm{D}=$ down.
Remember totake care when you are typing the listing into your machines. If you make a mistake it could mean many frustrating moments.
So to save your sanity check each line carefully - and only turn to the Bug Hunter as a last resort!

BY RICHARD BARTON

RUNS ON AN UNEXPANDED VIC-20

## Variables

$\mathbf{Z}=$ step count for display on screen.
$\mathrm{CO}=$ colour address offset from character address.
S1, S2, S3 = Vic sound addresses.
V = volume.
U, D, L, R = represent screen codes form various arrows
(Tracker).
G = Grid display.
$\mathbf{C}=$ border of grid .
$\mathbf{Q}=$ fugitive position.
$\mathrm{X}=$ tracker position.
$\mathrm{Y}=$ represents whatever arrow code is being used at any time (U, D, LR) (e.g. = Y = R).
MS = special sound effect routine.
$\mathrm{T}=$ time delay.

Late at night, when we were sitting around looking at programs for this year book in the C\&VG office we suddenly hear a mysterious sniffing sound coming from the computer room. Expecting to find Mal Function up to no good among the software we crept up to the door and slowly pushed it open. Not a Bug in sight. But sitting in the middle of the floor was a small round yellow being with a small tear running down its chubby cheek. A Pac-man. "What's wrong litthe fellow?" we asked. "T've heard you are doing a great programs we have known section in the yearbook," it said, wiping away another tear. "Why, yes," we replied, "But why are you upset? Pacmen are usually happy little creatures." "A little ghost told me that I was being left out!", it sobbed. "How could we leave you out! Everyone loves a Pac-man!"

Its round face brightened. "Really!" it exclaimed. "Of course!" we said. "Just wait until I see that ghost!" said the Pacman, gulping down a
powerpill, "I'll soon sort him out!" And with that he disappeared in a puff of golden smoke, leaving behind him this neat little listing for the Spectrum.

This program gets as close to the original arcade version as is possible within the limits of the Spectrum. There are four power pills, two escape tunnels, and all the video-pills a Pac-man can eat Because of the limitations of Basic there is only one ghost - but he's a mean Pachunter. And there's a nice twist to the original theme which gives the little muncher additional problems. The power pills can be transformed into poisonous pills by the devious ghost. While they are poisonous to the Pac-man the pills stop flashing. You get three lives as in the arcade version and the Pac-man is controlled by using the " $\mathbf{Q}$ " key to move up, " 2 " down, " $\mathrm{M}^{\prime}$ " left and " $N$ " right.
Program notes
When entering the mazeprinting section of the program the dots are full stops

## Glossary of Computer Terms

## 6502

The CPU chfpuseditr many popular home computers, e.g. BBC, and Oric, also in the Atari VCS games centre.

## 6809

A newer CPU chip with some similarities to the 6502. As used in the Dragon-32.

## Absolute

A way of specifying movement on the screen whioh bears no relation to where you are moving from. E.g., Move to coordinates $(10,9)$. See also relative.

## Accumulator

The main register in the CPU on which arithmetic and other instructions operate. To use certain functions on other registers requires copying that register into the accumulator, operating on it and then returning the registers to their original state.

## Address

A name, number or label indicating a position in the computer's memory.

## Adventure

The name given to computer simulations of fantasy role-playing games. The machine plays the part of the adventurer which you control by giving instruetions from the keyboard usually in plain English. The objective is usually to find treasure.

## Algorithm

A detailedstep-by-step description of a problem which can then be solved by translation into part of a computer prógram.

## Append

A Basic command to load data or a programinto the computer and add it on to the end of whatever is there already.

## Argument

The value on which a Basic function operates. e.g., POKE has two arguments: an address and its contents.

## Array

A way of storing related pieces of information in the computer, so that each element of the array shares a common variabto-name. E.g., instead of storing a list of addresses as A, B, C and their 'phone numbers as D, E, F, two arrays could beused so that the addresses would be labelled $A(1), A(2), A(3)$ and the phone numbers as $P(1), P(2)$ and $P(3)$. Then, finding the phone number for a known address becomes simple.

## ASCI I

A Basic function to give the ASCII code of the character in the brackets. e.g.
PRIYYF-ASC("A")
will print 65 . If you usg ASC on àstting, the function will return the ASCII code of the first character in the string.

## ASCI

American Standard Code for Information Interchange. A standard code used in most micros to represent 128 characters in a 7 bit code.

## Assembler

A program which helps in writing pachine code programs, It allows the programmer to enter mabhinexdde instructions using mnemonic codes whicharee easier to temember than the hex values. eg., in 6502 machine code one way of loading a value into the accumulator is by using hex code A9. With an assembler, the load-accumulator instruction is LDA.

## ATIR

A Basic function on the ZX Spectrum used to find data about a certain point on the screen. For a pair of coordinates it returns the colour of the screen at that point, whether it is in extra-bright mode and whether that particular character is flashing or steady.

## Basic

Beginners' All-purpose Symbolic Instruction Code. A programming language invented in America in 1964 and available in almost all computers from those running power stations to those playing Space Invaders.

## BAUD RATE

The speed at which data bits are sent down a wire. Baud rate is approximately equal to bits per second; so with an average of ten bits per byte an interface working at 300 baud can transmit or send about 10 characters per second (or CPS.)

## BEEP

The command used in Basic of the $2 \times$ Speqtrum and Jupiter Ace to produse sound from the built-in speaker. The two argumerts arespitch and duration, where pitch is relative to middle-C and duration is specified in a range from 0 to 255 .

## Binary

Base two. The way in which all information is represented in the computer internally. The only digits used are 1 and 0 which correspond to an electrical signal either being prescert in a wire or not.

## Bit

A short form for binary digit, arsingle 1000.

## Border

An area round the edge of a playing screen which can be a different colour from the main playing area. Used mainly to ensure that the whole of the game is visible on the screen.

## Bright

A Besiceommand to print on the screen in varying brightness. An Atari 800 has 16 variations while a Spectrum
has two.

## Bug

An error in a program which prevents it from working, properly.

## Byte

A short form of Bmafy Eightt used to describe a set of eight bits.

## Cassette

A (usually) plastic case containing magnetic tape on which programs can be stored using two frequencies. The computer can "Hietes" to a cassette and reconstruct the program at a later date. One frequency is used to represent a 1 and another forazero) (see binary).

## Centronics

A form of interface for computers used in connecting printers. The centronics interface is a parallel device as opposed to the RS232 interface. It uses eight separate wires for the date and a complete byte is sent at a time. Originally used in a range of printers by Centronics, this interface is now standard or optional in most micro printers.

## Character

A letter, number or other symbol which is represented by a unique code in the computer. The usual number of characters is up to 255 , which represent numbers, letters and other spepresed control characters which mean special things like "turnon pminer" or "change to upper or lower case".

## Character set

The range of characters which a computer is able to produce. Some machines have special character sets with mathematical signs or non-Englisfrangyages.

## Chip

An electronic circuit reduced photographically and produced on a piece of silicon of around $1 / 4$ inch square. The final version of a chip is much larger to accommodate the pins which are used to connect the chip to the outside world.

## CHRS ( )

A Basic function to output a character whose ASC I code is known. E.g.,

> PRINT CHR\$(65)
will print a çapital letter A.

## ehumiry graphics

The term used to describe graphics madefrem whole characters as opposed to pixels. These characters are often whole blocks with one or more quaberstempved. As found on machines like the ZX81.

## CLOAD

A Basic command to load a program from a cassette as opposed to loading from disk.

## Command

A statement in Basic may be either a command dr a function. A command tells the computer to do something and does not expect a numerical or alphabetical result, while a function does. So addition and PEEK are functions but POKE and LIST

## Compiler

A program which converts a program written in a high level language such as Basic to machine code. This may be useful because machine code programs are hard to write but run much faster than those in Basic. Compilers are often used in the writing of game programs for this reason. A compiler differs from an interpreter because an interpeter translates each line as it is encoupreres, which may be many times during a run, while acompilertt anslates each line once, at the start, before the programt is run.

## Copyright

The area of the law which allows the originator of a piece of work the exclusive right to make copies of that work. No copyright laws specific to computer programs exist at present. The difficulties arise over the idea of a program as much as the program itself. Because the author of a program is entitled to a payment for each copy sold, copying of programs illegally is considered theft.

## CPU

Central Processing Unit. The majnehip in a computer which organises the work of all the ornecompgnents in the machine as well as performibgtogisal an arithmetic functions.

## CSAVE

A Basic command to save a program onto cassette.
Cursor
A marker on the screen of a computer to show where, if a key is pressed, the next character will appear.

## Data

Informationvpiek a program needs before or during a run E.g., a prggram to tida W a square needs to know where on the screen the corners aresto be. Note that data in this sense is a plural word as in a list of data. A single item in that list is called a datum.

## DATA

A command in Basic which is used to supply data to the program. The word DATA is followed by the data itsalf, with each datum separated by a comma. To access thig dgtating function READ is used.

## Debug

To ensure that a program works properly by removing the bugs from it.

## Decimal

The most common way of representing nambers. It uses the digite 5 : Also known as base 10, or denary.

A command used in Basic to reserve space in the computer's memory for an array. Most machines will automatically allow for an array to have 10 elements so if you plan to have anything larger you must use DIM. To reserve enough space for array D to have 75 elements, use the command DIM D(75). Short for DIMension.

## DIN

Deutsche Industrie-Norm. A Germen-designed standard of connections used extensively m audjg equipment and, therefore, also in the conbecting of caspette recorders to computers. A DIN connector usually has between three and seven connecting pins.

## Disk (or Disc)

An alternative medium to cassettes on which computers can store programs and data. It consists of a thin circle of plastic coated in a similar substance to cassette tape and housed in a 1 extbe, protective plastic jacket, which is why they are often calledilo py disks or floppies. They are available either 5.25 or 8 inches across and need a special machine called a disk drive for them to be used.

## Disk Drive

The machine which is used to get information on and dif disks. Once a disk is inside the drive it is rotated against a head similar to that in a cassette recorder. Disk storage is up to 50 times faster thenusing cassettes but is also more expensive. An average.drive costs 10 times more than a cheap portabletassotte recorder.

# UNBEATABLE 

STREETS AHEAD . . . IN YOUR HIGH STREET NOW!

Mulberry House, Canning Place, Liverpool L1 8JB. Telephone: 051-709 7071

## Edit

To alter part of a program while leaving the rest unchanged. This can range from the addition of a single character to the removal of a larefatpeck of the program.

## Element

A single part of an array identified by the array's name and the element's unique subscript.

## END

A basic command to tell the computer that the end of the program has been reached.

## ENVELOPE

A command used in Basic on the BBC micro to define the characteristics of a note which will be produced by the BBC's SOUND command. ENVELOPE defines the actual wave form of the pote, and can be used to simulate the sound of various instronetits
EPROM
Erasable Programmable Read-Only Memory. A ROM chip which can be re-used by exposing it to ultra-violet light which erases it.

## File

A collection of related pieces of data stored for use by the computer on tape or disk.

## Fixed point

The way the computer stores numbers. Instead of moving the decimal point around it is always placed afterthe first digit. Then the entire number is multiplied or alvidedty) p factor of 10 to make it the correct value. For example $1 / 10=10^{-1}$
so 0.168 in fixed point format would be $1.68 \times 10^{-1}$

## Eloating point

The normal way of specifying decimal fractions. The decimal point is placed between the whole part anctaé fractional part of the number.

## Floppy disk

see Disk.

## FOR

A Basic command to perform part of a program a certain fixed number of times. The part to be repgated is placed between a FOR statement and a NEXTstasemegt

## Forth

A computer programming language. It is the language of the Jupiter Aceand is also available for some other micros. Althobigh slightly harder to learn than Basic it runs much faster and is useful for writing games programs. Was originally to be known as "fourth" as in fourth-generation language, but the computer on which it was invented only allowed 5 characters for a program name!

## Function <br> see Command.

## GET

A Basic function to get a single key press from the keyboard.

## GOSUB

A Basic command which jumps to a certain part of the program called a subroutine. These are useful where the same part of a program may be "called" several times. The subroutine may consist of several program lines and will continue until it finds a RETURN statement. Then control returns to the line after the initial GOSUB.

## GOTO

Jumps to a certain point in a Basig program and continues to run from that point.

## Graphics characters

Characters which the computer can print apart from normal letters and numbers. These can be used in blocks to form pictures. See also Characters.

## Hardware

The physical components of a computer which can actually be seen, as oproseg fo programs and data which cannot.

## Hexadecimal

(or Hex.) A way of specifying numbers in base 16. Hex uses 15 digits, namely 0 to 9 and then $A$ to $F$. So eleven in hex is B, and hex 10 is 16 in decimal.

## High level language

A programming language in which the language itself does some of the work for you. For example, Basic is a high level language because most of the commands available in Basic are not available directly in the computer but must be broken down into many simple instructions by 4 he Basic interpreter.

## INRE

sed in Spectrum and Oric Basic to specify the colour in which printing on the screen will be.

## INKEY

Similar to GET. As used on Sinclair computers.

## INPUT

A Basic function to get a key or heysfogn the keyboard. Keeps getting keys until tile fREFBN or ENTER key is pressed.

## INT

A Basic function to strip a number of its decimal places and leave the integer part. Note that INT will not round the number up or down so $\operatorname{INT}(5.01)$ is the same as $\operatorname{INT}(5.99)$.

## Intĕger

A number, positive or negative, which has no fractional part. $1,2,3,-9,-96$ are integers, whereas 7.5 is not.

## Interpreter

The program whichecodes the statements in a high level language. It converfs the dipes which you type into simple steps which the CPU san understand.

## Jack plug

A connector used for linking cassette recorders to computers.

## Joystick $\rightarrow$ ।

A hand-operated controller for video games. A short stick can be pushed in 4 or 8 directions which controls the object on the screen. There is also usually a "fire" button.

## K (or Kb.)

Stands for Kilobytes or a 1024 bytes. The unit used to measure the size of a computer's memory. Usually goes up in multiples of 4 or 8 . One byte is equal to about 1 character.

## Language

The set of commands with which a computer is programmed. Basic is the most common language for beginners but special languages also exist for certain jobs. Cobol is mainly used for writing-busieess programs while Fortran is a science and praths-based lifnguage.

## LEFTS

The Basic function to take the leftmost characters from a string, thus LEFT\$(S\$,5) would takethe first five characters of string S\$.

## LET

Used in Basic to assign a value to a variable, eg., LET $X=10$ or LET S\$="HELLO".

## Line number

Each line in a Basic program must have aline number. When the program is run the lines will be executedin numperical order, and not the order in which they were typed in.

## LIST

A Basic command to produce a copy of the current program opthe screen'o printer.
LLIST
List the Basic program on the printer,

## LOAD

Read a program into the computer from cassette or disk.

## Location

The actual position in memory where a byte is stored.
Low level language
A language in which a limited number of commands can be handled directly and they must be broken down and simplified by the -prdgrammer.

## Lower case

The small, non-capital letters available on a keyboard. The characters produced by pressing a key without holding down a shift key.

## LSI

Large Scale Integratign. Gettingal ot of components into a small area on a chip.

## LPRINT

A Basic command to output to the printer as opposed to the screen.

## Machine code

The lowest level language available on a computer. It is the language which the CPU can directly understand and because it does not need an interpreter, machine code programs run very fast but are complicated to write and debug. A typical machine code program may run 100 times

## Memory map

The way in which the computer organizes its memory. The memory map states where the machine holds its program, variables and Basic interpreter. Most computers also hold the contents of the screen in memory as well so that altering that area of memory will change the contents of the screen. This is known as having a memory-mapped screen.

## Merge

Loading afprogramor data without destroying the one already in memory. Where program lines are duplicated, the convention is for the incoming line to replace the one already there.

## Microprocessor

A single chip which can get information in, processit and output it.
Similar to CPU.

## Microsoft

A software company responsiblefowiting the Basic interpreters in many micros.

## MID 5

A function in Basic to extract a certain part of a string starting from a certain position and going on for a certain number of characters. $\operatorname{MID} \$(A \$, 5,3)$ will be a string made up from AS starting at position 5 and continuing for 3 characters.

## Mnemonic

A short code which helps in remembering sometling. For example, in $\mathbf{Z 8 0}$ machine code, the code to compare the accumulator with a value is known-by the mnemonic CP A.

## MODEM

Short for MOdulator/DEModulator. A peripheral to convert the signals sent from a computer to the correct frequencies to allow them to be sent over the telephone lines and fed into another computer.

## MOnitor

A device used as the display for a computer. It is similar to a TV screen but is of much higher quality and costs more. Monitors cannot normally receive TV signals. A typical colour monitor costs at least twice the price of a portablecolour TV.

## Monochrome

Single colour. A computer display which cannot show more than one colour. Ustally black and white but can also be green on black-or orange op black.

## Network

A number of computers connected together such that each can communicate with any other and that they can share peripherals which would be too expensive to provide for each computer.

## NEW

A Basic command to tell the computer to forget the current program and to expect another one.

## NEXT

see FOR.

## Nybble

Half of a byte ( 4 bits.) A byte is made up from two nybbles. The first 4 bits are called the high nybble and the last four are called the low nybble.

## Operating system

The program in the computer which controls the coordination of all the components. Every computer has an operating system. Some operating systems are common to many computers subject to minor alterations. One such system is CP/M which runs on many Z80 based machines. CP/M controls the loading and saving of programs and also control of the disc drive, keyboard and printer. Commands to load and save on one CP/M machine will be almost identical on any other machine with the same operating system.

## OVER

A Basic command to print on the screen on top of the character which is already there.

## PAPER

A command on the Spectrum and Ace to specify the colour of the screen.

## PEEK

A Basic function to look at the contents of a certain location in memory. For example, the character at the centre of the screen on a PET is held in memory location 33268. So to see what character is at the centre of the screen you would use PEEK (33268).

## Peripheral

Additional hardware used with a computer but not an integral part of it. Eg. a disk drive, cassette recorder, printer or joystick.

## Phono plug

A connector commonly used to connect a computer to a TV set or monitor.

## Pixel

Short for Picture Element.
The smallest dot which can be displayed by a computer. Pixels can be used individually or be placed in blocks to make alphabetic or graphics characters.

## POKE

A Basic command to load a certain value into a known location in memory. The syntax of the command is:

POKE address, value
so to put character 46 (a full stop) at the centre of the screen on a PET, type POKE 33268,46.
See also PEEK.

## Printer

A peripheral used to produce output onto paper which can then be stored, as opposed to output on a VDU which cannot.

## Program

A list of instructions which will be executed sequentially by the computer.
PROM
Programmable Read-Only Memory.
A ROM chip which can be programmed by a special PROM programming machine. One programmed a PROM cannot be altered or erased.

## RAM

Random-Access Memory.
Memory in a computer which can be altered and is therefore used to hold the current Basic program and data. RAM memory loses its contents when the power is turned off.

## Raster scan

The way in which a TV picture is produced in the set itself. A single dot scans across the 625 horizontal lines which make up the picture. Whatever the display on the screen, the dot always follows the same course. It goes so fast that the display appears steady and stationary.

## READ

Used in Basic with a DATA statement. It reads one item from the DATA list each time it is called.

## Register

A memory location built into the CPU chip itself, used to hold data temporarily to perform arithmetic and logical functions.

## Relative

A way of specifying direction which does not depend on where you are going but on where you are coming from. Eg., "move 7 positions to the left" is a relative direction.
See also Absolute.

## RENUMBER

A Basic command to alter the line numbers of a program so that they all run in even, neat steps. RENUMBER should also alter any GOTO or GOSUB statements as well to enable the program to run correctly.

## Resolution

The number of pixels which a computer can display on the screen at one time. The higher the number, the better quality graphics can be produced.

## RESTORE

Used in Basic with READ and DATA. RESTORE sets the data pointer back to the beginning so that the next READ statement will start reading from the first item in the DATA statement.

## RETURN

See GOSUB.

## RIGHTS

Similar Basic command to LEFT\$ but takes the last characters from a string. Eg., RIGHT\$ ("therefore", 4) would be "fore".

## RND

A Basic function to produce a random number, used in games and simulations.

## ROM

Read-Only Memory.
A memory chip whose contents cannot be altered. ROMs are used to hold such things as the Basic interpreter and the operating system.

## PC23?

The name of an interface used for connecting computer peripherals together. All devices with RS232 interfaces should by definition have the same connections via a 25 pin D-plug although some manufacturers vary these for their own use. The RS232 is a serial interface which means that although there are 8 bits to a byte the bits are sent one at a time down a single wire.
See baud rate.

## RUN

A Basic command to start the execution of the current program in the computer.

## SAVE

A Basic command to record the current program on to cassette or disk, so that it can be re-used at a later date.

## Scroll

Moving the contents of the screen up or down by a single pixel or character at a time. Some programs also scroll the screen sideways.

## Shoot-'em-up

A video game where the object is to shoot at aliens which are above you. The first such game was Space Invaders.

## Software

Programs for a computer. The part of the computer which cannot actually be seen (unless printed out on screen or printer) See also Hardware.

## String

A set of between 1 and 255 characters assigned to the same variable name. Some Basics allow strings of unlimited length, but most allow 255, which is the highest number which can fit in 1 byte.

## Subroutine

A frequently-used part of a program, placed, usually at the end, which can be called whenever needed. Thus although it is used frequently, it only needs to be typed in once.
See also GOSUB.

## Subscript

A number used to identify single elements in an array. Although each element has the same variable name they have different subscripts. Eg, LET A\$(7) = "COMPUTER"
where the variable name is $A \$$ and the subscript is 7.

## Syntax

The composition of a statement, its arguments and any punctuation. Eg., a certain Basic statement may need two arguments, separated by commas and a semi-colon at the end. If this is not typed correctly it will be rejected by the computer with a "SYNTAX ERROR" message.

TRACE
A command in Basic which prints out the line number of each statement as it is executed. This can be useful in debugging to check that the program lines are being executed in the correct order.

## Upper case

The characters available on a computer by pressing a key at the same time as pressing a shift key. The shift key usually punctuation and graphics for the others.

## User defined graphics

Graphics characters made up of a block of pixels which can be designed by the user. Custom characters can then be made, like a Pacman figure or a space invader.

## User friendly

Describes a program which is easy to operate by non-computer minded people.
A good user-friendly program will help the operator and should produce helpful messages in response to mistakes from the user.

## USR

Used to transfer execution from the Basic program being executed to a machine code routine written by the user. This may be done if a certain part of the program needs to be executed very fast or for certain things which Basic cannot do.

## VDU

Visual Display Unit.
A monitor or TV used as the output device for a computer.

## Vector Scan

The alternative to raster scan. Instead of scanning the whole screen, the dot traces out the shape of whatever it is required to produce. Programming such a device needs great care because if the dot is allowed to stop for just a fraction of a second it will burn straight through the screenl Vector scan produces clearer, smoother graphics.
As used in some arcade games like Atari's Asteroids, and also in the Vectrex.

## Verify

Used in Basic to compare the program currently in RAM with one on tape or disk, to ensure that it has been SAVED correctly.

## Word processor

A program to accept text from the keyboard and help in producing written documents. A good word processor will align the text to the margins, store standard letters on disk etc. Separate files of addresses can be stored so that a single letter need only be in typed once but can be printed many times with different addresses on top.

## 280

A common CPU used in many micros including the Spectrum and Sharp MZ80K.

Muppet creator Jim Henson put his puppeteers to work on a fantasy epic last year.
He created a land peopled by the weird Mystics, cruel Skeksis and gentle Pod People. Through this world two Gelflings are sent on a quest to break the rule of the Skeksis and return peace to the land.
A computer program of the quest was released and we at Computer and Video Games asked readers to come up with their own graphic representations of the weird and wonderful creatures from the world of the Dark Crystal.
head of Aughra, one of the "stars" of the film, flown over from America, the book of the film - beautifully illustrated by artist Brian Frood - and an LP of the film score.
When Bruce McNally, Henson Associates' creative director came in to judge the entries, he found a runaway winner in Alan Outter's marvellous representation of Jen the Gellling on the BBC.
We show a screen picture of the winning entry over the page and for those who are feeling brave enough to key it in we reproduce the listing to show the work

## By Alan Outter Runs on the BBC Model B

## PLAY Thevssozananafan : Kemt

Campbell's dramatic adventure set on a spacecraft on a deep-space mission.
INTERSTELLAR INTRIGUE: Mike Singleton challenges you to outwit up to four opponents as you try to take over the known galaxy.
THE BEACON STAR WAR: Mining vessels, gun-ships and stargates battle it out in Ron Potkin's classic wargame, set among the strange alien space scavangers.
PIRATES \& POLYPS: Arcade style co-ordination is needed to keep the pirates from the valuable polyps as you try to catch them in the rays of your space scanner. By Pat Norris.
$\square<$ Pages of Bugs
cartoons * Pages to puzzle over $\star$ Tips on Spectrum, Vic,
Atari, BBC and Dragon programming - from the experts $\star$ And a whole host of features from the people behind Britain's top computer magazine.
